OWLAPY¹: Representation of OWL objects in python.

1 About owlapy

Version: owlapy 1.4.0

GitHub repository: <https://github.com/dice-group/owlapy>

Publisher and maintainer: DICE² - data science research group of Paderborn University³.

Contact: onto-learn@lists.uni-paderborn.de

License: MIT License

1.1 What is owlapy?

Owlapy is an open-source software library in python that is used to represent entities in OWL 2 Web Ontology Language.

We identified the gap of having a library that will serve as a base structure for representing OWL entities and for manipulating OWL Ontologies in python, and like that, owlapy was created. Owlapy is loosely based on its java-counterpart, *owlapi*. Owlapy is currently utilized by powerful libraries such as [Ontolearn](#)⁴ and [OntoSample](#)⁵.

Owlapy is the perfect choice for machine learning projects that are built in python and focus on knowledge graphs and class expression learnings.

1.2 What does owlapy have to offer?

- Create, manipulate and save Ontologies.
- Retrieving information from the signature of the ontology.
- Reasoning over ontology.
- Represent every notation in [OWL 2 Structural Specification and Functional-Style Syntax](#)⁶ including:
 - Entities, Literals, and Anonymous Individuals
 - Property Expressions
 - Data Ranges
 - Class Expressions

¹ <https://github.com/dice-group/owlapy>

² <https://dice-research.org/>

³ <https://www.uni-paderborn.de/en/university>

⁴ <https://github.com/dice-group/Ontolearn>

⁵ <https://github.com/alkidbaci/OntoSample>

⁶ <https://www.w3.org/TR/owl2-syntax/>

- Axioms
- Annotations
- Construct complex class expressions.
- Provide interfaces for OWL Ontology, Ontology manager and Reasoner.
- Convert owl expression to SPARQL queries.
- Render owl expression to Description Logics or Manchester syntax.
- Parse Description Logics or Manchester expression to owl expression.

1.3 How to install?

Installation from source:

```
git clone https://github.com/dice-group/owlapy
conda create -n temp_owlapy python=3.10.13 --no-default-packages && conda activate_
↪temp_owlapy && pip3 install -e .
```

or using PyPI:

```
pip3 install owlapy
```

2 Basic Usage

The main usage for owlapy is to use it for class expression construction. Class expression learning algorithms require such basic structure to work upon. Let's walk through an example of constructing some class expressions.

In this example we will be using the *family* ontology, a simple ontology with namespace: `http://example.com/family#`. Here is a hierarchical diagram that shows the classes and their relationship:

```

      Thing
      |
    person
    /  |
  male female

```

It contains only one object property which is `hasChild` and in total there are six persons (individuals), of which four are males and two are females.

2.1 Atomic Classes

To represent the classes `male`, `female`, and `person` we can simply use the class `OWLClass`⁷:

```
from owlapy.class_expression import OWLClass
from owlapy.iri import IRI

namespace = "http://example.com/family#"

male = OWLClass(IRI(namespace, "male"))
female = OWLClass(IRI(namespace, "female"))
```

(continues on next page)

⁷ https://dice-group.github.io/owlapy/autoapi/owlapy/class_expression/owl_class/index.html#owlapy.class_expression.owl_class.OWLClass

(continued from previous page)

```
person = OWLClass(URI(namespace, "person"))
```

Notice that we created an `URI` object for every class. `URI`⁸ is used to represent an *IRI*. Every named entity requires an *IRI*, whereas Anonymous entities does not. However, in owlapy you can create an *OWLClass* by passing the *IRI* directly as a string, like so:

```
male = OWLClass("http://example.com/family#male")
```

2.2 Object Property

To represent the object property `hasChild` we can use the class `OWLObjectProperty`⁹:

```
from owlapy.owl_property import OWLObjectProperty

hasChild = OWLObjectProperty("http://example.com/family#hasChild")
```

Tip: In owlapy the naming of the classes is made in accordance with the notations from OWL 2 specification but with the word “OWL” in the beginning. Example: “*OWLObjectProperty*” represents the notation “*ObjectProperty*”.

2.3 Complex class expressions

Now that we have these atomic entities, we can construct more complex class expressions. Let’s say we want to represent all individuals which are `male` and have at least 1 child.

We already have the concept of `male`. We need to find the appropriate class for the second part: “*have at least 1 child*”. In OWL 2 specification that would be `ObjectMinCardinality`¹⁰. In owlapy, as we said, we simply add the word “OWL” upfront to find the correct class:

```
from owlapy.class_expression import OWLObjectMinCardinality

has_at_least_one_child = OWLObjectMinCardinality(
    cardinality = 1,
    property = hasChild,
    filler = person
)
```

As you can see, to create an object of class `OWLObjectMinCardinality`¹¹ is as easy as that. You specify the cardinality which in this case is 1, the object property where we apply this cardinality restriction and the filler class in case you want to restrict the domain of the class expression. In this case we used `person`.

Now let’s merge both class expressions together using `OWLObjectIntersectionOf`¹²:

```
from owlapy.class_expression import OWLObjectIntersectionOf

ce = OWLObjectIntersectionOf([male, has_at_least_one_child])
```

⁸ <https://dice-group.github.io/owlapy/autoapi/owlapy/iri/index.html#owlapy.iri.URI>

⁹ https://dice-group.github.io/owlapy/autoapi/owlapy/owl_property/index.html#owlapy.owl_property.OWLObjectProperty

¹⁰ https://www.w3.org/TR/owl2-syntax/#Minimum_Cardinality

¹¹ https://dice-group.github.io/owlapy/autoapi/owlapy/class_expression/restriction/index.html#owlapy.class_expression.restriction.OWLObjectMinCardinality

¹² https://dice-group.github.io/owlapy/autoapi/owlapy/class_expression/nary_boolean_expression/index.html#owlapy.class_expression.nary_boolean_expression.OWLObjectIntersectionOf

2.4 Convert to SPARQL, DL or Manchester syntax

Owlapy is not just a library to represent OWL entities, you can also use it to convert owl expressions into other formats:

```
from owlapy import owl_expression_to_sparql, owl_expression_to_dl, owl_expression_to_
↳manchester

print(owl_expression_to_dl(ce))
# Result: male ♂ (≥ 1 hasChild.person)

print(owl_expression_to_sparql(ce))
# Result: SELECT DISTINCT ?x WHERE { ?x a <http://example.com/family#male> . { SELECT_
↳?x WHERE { ?x <http://example.com/family#hasChild> ?s_1 . ?s_1 a <http://example.
↳com/family#person> . } GROUP BY ?x HAVING ( COUNT ( ?s_1 ) >= 1 ) } }

print(owl_expression_to_manchester(ce))
# Result: male and (hasChild min 1 person)
```

To parse a DL or Manchester expression to owl expression you can use the following convenient methods:

```
from owlapy import dl_to_owl_expression, manchester_to_owl_expression

print(dl_to_owl_expression("∃ hasChild.male", namespace))
# Result: OWLObjectSomeValuesFrom(property=OWLObjectProperty(IRI('http://example.com/
↳family#', 'hasChild')),filler=OWLObject(IRI('http://example.com/family#', 'male')))

print(manchester_to_owl_expression("female and (hasChild max 2 person)", namespace))
# Result: OWLObjectIntersectionOf((OWLObject(IRI('http://example.com/family#', 'female
↳')), OWLObjectMaxCardinality(property=OWLObjectProperty(IRI('http://example.com/
↳family#', 'hasChild')),2,filler=OWLObject(IRI('http://example.com/family#', 'person
↳')))))
```

In these examples we showed a fraction of **owlapy**. You can explore the *api documentation* to learn more about all classes in owlapy and check more examples in the `examples`¹³ directory.

3 Ontologies

To get started with Structured Machine Learning, the first thing required is an *Ontology*¹⁴ with *Named Individuals*¹⁵. In this guide we show the basics of working with ontologies in Owlapy. We will use the *father* ontology for the following examples.

3.1 Loading an Ontology

To load an ontology as well as to manage it, you will need an *OWLOntologyManager*. An ontology can be loaded using the following Python code:

```
from owlapy.iri import IRI
from owlapy.owl_ontology_manager import OntologyManager
```

(continues on next page)

¹³ <https://github.com/dice-group/owlapy/tree/develop/examples>

¹⁴ <https://www.w3.org/TR/owl2-overview/>

¹⁵ https://www.w3.org/TR/owl-syntax/#Named_Individuals

(continued from previous page)

```
manager = OntologyManager()
onto = manager.load_ontology(IRI.create("file://KGs/Family/father.owl"))
```

First, we import the `IRI` class and a suitable `OWL OntologyManager`. To load a file from our computer, we have to reference it with an *IRI*. Secondly, we need the Ontology Manager. Owlapy contains one such manager: The *Ontology-Manager*.

Now, we can already inspect the contents of the ontology. For example, to list all individuals:

```
for ind in onto.individuals_in_signature():
    print(ind)
```

You can get the object properties in the signature:

```
onto.object_properties_in_signature()
```

For more methods, see the abstract class *OWLOntology* or the concrete implementation *Ontology*.

3.2 Modifying an Ontology

Axioms in ontology serve as the basis for defining the vocabulary of a domain and for making statements about the relationships between individuals and concepts in that domain. They provide a formal and precise way to represent knowledge and allow for automated reasoning and inference. Axioms can be **added**, **modified**, or **removed** from an ontology, allowing the ontology to evolve and adapt as new knowledge is gained.

In owlapy we also have different axioms represented by different classes. You can check all the axioms classes *here*. Some frequently used axioms are:

- *OWLDeclarationAxiom*
- *OWLObjectPropertyAssertionAxiom*
- *OWLDataPropertyAssertionAxiom*
- *OWLClassAssertionAxiom*
- *OWLSubClassOfAxiom*
- *OWLEquivalentClassesAxiom*

Add a new Class

Let's suppose you want to add a new class in our example ontology `KGs/Family/father.owl`. It can be done as follows:

```
from owlapy.class_expression import OWLClass
from owlapy.owl_axiom import OWLDeclarationAxiom

iri = IRI('http://example.com/father#', 'child')
child_class = OWLClass(iri)
child_class_declaration_axiom = OWLDeclarationAxiom(child_class)

onto.add_axiom(child_class_declaration_axiom)
```

In this example, we added the class 'child' to the *father.owl* ontology. Firstly we create an instance of *OWLClass* to represent the concept of 'child' by using an *IRI*. On the other side, an instance of `IRI` is created by passing two arguments which are the namespace of the ontology and the remainder 'child'. To declare this new class we need an axiom of type *OWLDeclarationAxiom*. We simply pass the `child_class` to create an instance of this axiom. The final

step is to add this axiom to the ontology. We use the `add_axiom` method to add into the ontology onto the axiom `child_class_declaration_axiom`.

Add a new Object Property / Data Property

The idea is the same as adding a new class. Instead of `OWLClass`, for object properties, you can use the class *OWLObjectProperty* and for data properties you can use the class *OWLDataProperty*.

```
from owlapy.owl_property import OWLObjectProperty, OWLDataProperty

# adding the object property 'hasParent'
hasParent_op = OWLObjectProperty(URI('http://example.com/father#', 'hasParent'))
hasParent_op_declaration_axiom = OWLDeclarationAxiom(hasParent_op)
onto.add_axiom(hasParent_op_declaration_axiom)

# adding the data property 'hasAge'
hasAge_dp = OWLDataProperty(URI('http://example.com/father#', 'hasAge'))
hasAge_dp_declaration_axiom = OWLDeclarationAxiom(hasAge_dp)
onto.add_axiom(hasAge_dp_declaration_axiom)
```

See the *owlapy* for more OWL entities that you can add as a declaration axiom.

Add an Assertion Axiom

To assign a class to a specific individual use the following code:

```
from owlapy.owl_axiom import OWLClassAssertionAxiom

individuals = list(onto.individuals_in_signature())
heinz = individuals[1] # get the 2nd individual in the list which is 'heinz'

class_assertion_axiom = OWLClassAssertionAxiom(heinz, child_class)

onto.add_axiom(class_assertion_axiom)
```

We have used the previous method `individuals_in_signature()` to get all the individuals and converted them to a list, so we can access them by using indexes. In this example, we want to assert a class axiom for the individual `heinz`. We have used the class `OWLClassAssertionAxiom` where the first argument is the 'individual' `heinz` and the second argument is the 'class_expression'. As the class expression, we used the previously defined class `child_Class`. Finally, add the axiom by using `add_axiom` method of the *OWLOntology*.

Let's show one more example using a `OWLDataPropertyAssertionAxiom` to assign the age of 17 to `heinz`.

```
from owlapy.owl_literal import OWLLiteral
from owlapy.owl_axiom import OWLDataPropertyAssertionAxiom

literal_17 = OWLLiteral(17)
dp_assertion_axiom = OWLDataPropertyAssertionAxiom(heinz, hasAge_dp, literal_17)

onto.add_axiom(dp_assertion_axiom)
```

OWLLiteral is a class that represents the literal values in Owlapy. We have stored the integer literal value of '17' in the variable `literal_17`. Then we construct the `OWLDataPropertyAssertionAxiom` by passing as the first argument, the individual `heinz`, as the second argument the data property `hasAge_dp`, and the third argument the literal value `literal_17`. Finally, add it to the ontology by using `add_axiom` method.

Check the [owlapy](#) to see all the OWL assertion axioms that you can use.

Remove an Axiom

To remove an axiom you can use the `remove_axiom` method as follows:

```
onto.remove_axiom(dp_assertion_axiom)
```

The required argument is the axiom/axioms you want to remove.

3.3 Save an Ontology

If you modified an ontology, you may want to save it as a new file. To do this you can use the `save` method of the *OWLOntology*. It requires one argument, the IRI of the new ontology.

```
onto.save(IRI.create('file://' + 'test' + '.owl'))
```

The above line of code will save the ontology `onto` in the file `test.owl` which will be created in the same directory as the file you are running this code.

3.4 Worlds

Owlready2 stores every triple in a ‘World’ object, and it can handle several Worlds in parallel. Owlready2 uses an optimized quadstore to store the world. Each world object is stored in a separate quadstore and by default the quadstore is stored in memory, but it can also be stored in an SQLite3 file. The method `save_world()` of the ontology manager does the latter. When an *OWLOntologyManager* object is created, a new world is also created as an attribute of the manager. By calling the method `load_ontology(iri)` the ontology is loaded to this world.

It is possible to create several isolated “worlds”, sometimes called “universe of speech”. This makes it possible, in particular, to load the same ontology several times, independently, that is to say, without the modifications made on one copy affecting the other copy. Sometimes the need to isolate an ontology arises. What that means is that you can have multiple references of the same ontology in different worlds.

It is important that an ontology is associated with a reasoner which is used to infer knowledge from the ontology, i.e. to perform ontology reasoning. In the next guide we will see how to use a reasoner in Owlapy.

4 Reasoners

To validate facts about statements in the ontology, the help of a reasoner component is required.

For this guide we will also consider the ‘father’ ontology that we slightly described [here](#):

```
from owlapy.iri import IRI
from owlapy.owl_ontology_manager import OntologyManager

manager = OntologyManager()
onto = manager.load_ontology(IRI.create("KGs/Family/father.owl"))
```

In our Owlapy library, we provide two main reasoner classes:

- **StructuralReasoner** (What used to be FastInstanceCheckerReasoner)

Structural Reasoner is the base reasoner in Owlapy. This reasoner works under CWA/PCWA and the base library used for it is *owlready2*. The functionalities of this reasoner are limited and may be incomplete. It does not provide

full reasoning in *ALCH*. It provides support for finding instance of complex class expression. It has a cache storing system that allows for faster execution of some reasoning functionalities.

Initialization:

```
from owlapy.owl_reasoner import StructuralReasoner

structural_reasoner = StructuralReasoner(onto, property_cache = True, negation_
↪ default = True, sub_properties = False)
```

The structural reasoner requires an ontology (*AbstractOWLOntology*). `property_cache` specifies whether to cache property values. This requires more memory, but it speeds up the reasoning processes. If `negation_default` argument is set to `True` the missing facts in the ontology means false. The argument `sub_properties` is another boolean argument to specify whether you want to take sub properties in consideration for `instances()` method.

- *SyncReasoner*

SyncReasoner is a class that serves as a ‘syncing’ class between our framework and reasoners in *owlapi*. It can perform full reasoning in *ALCH* due to the use of reasoners from powerful reasoners like *HermiT*, *Pellet*, etc. *SyncReasoner* is more useful when your main goal is reasoning over the ontology, and you are familiarized with the java reasoners (*HermiT*, *Pellet*, *JFact*, *Openllet*, ...).

Initialization:

```
from owlapy.owl_reasoner import SyncReasoner

sync_reasoner = SyncReasoner(ontology="KGs/Mutagenesis/mutagenesis.owl", reasoner=
↪ "HermiT")
```

SyncReasoner is made available by *owlapi mapper* and requires the ontology path or an object of type *SyncOntology*, together with a reasoner name from the possible set of reasoners: "HermiT", "Pellet", "JFact", "Openllet" "StructuralReasoner".

Note that *SyncReasoner* with `reasoner` argument set to "StructuralReasoner" is referring to *StructuralReasoner* implemented in *owlapi*. That is different from our *StructuralReasoner*.

4.1 Usage of the Reasoner

All the reasoners available in the Owlapy library inherit from the class: *AbstractOWLReasoner*. Further on, in this guide, we use *StructuralReasoner* to show the capabilities of a reasoner in Owlapy.

We will proceed to use the *father* dataset to give examples.

4.2 Class Reasoning

Using an *AbstractOWLOntology* you can list all the classes in the signature, but a reasoner can give you more than that. You can get the subclasses, superclasses or the equivalent classes of a class in the ontology:

```
from owlapy.class_expression import OWLClass
from owlapy.iri import IRI

namespace = "http://example.com/father#"
male = OWLClass(IRI(namespace, "male"))

male_super_classes = structural_reasoner.super_classes(male)
```

(continues on next page)

(continued from previous page)

```
male_sub_classes = structural_reasoner.sub_classes(male)
male_equivalent_classes = structural_reasoner.equivalent_classes(male)
```

We define the *male* class by creating an *OWLClass* object. The methods *super_classes* and *sub_classes* have 2 more boolean arguments: *direct* and *only_named*. If *direct=True* then only the direct classes in the hierarchy will be returned, else it will return every class in the hierarchy depending on the method (*sub_classes* or *super_classes*). By default, its value is *False*. The next argument *only_named* specifies whether you want to show only named classes or complex classes as well. By default, its value is *True* which means that it will return only the named classes.

NOTE: The extra arguments *direct* and *only_named* are also used in other methods that reason upon the class, object property, or data property hierarchy.

NOTE: In *SyncReasoner*, there is no use for the argument *only_named* as this is not supported by methods in the java library *owlapi*.

You can get all the types of a certain individual using *types* method:

```
anna = list(onto.individuals_in_signature()).pop(0)

anna_types = structural_reasoner.types(anna)
```

We retrieve *anna* as the first individual on the list of individuals of the 'Father' ontology. The *types* method only returns named classes.

4.3 Object Properties and Data Properties Reasoning

Owlapy reasoners offers some convenient methods for working with object properties and data properties. Below we show some of them, but you can always check all the methods in the *AbstractOWLReasoner* class documentation.

You can get all the object properties that an individual has by using the following method:

```
anna = individuals[0]
object_properties = structural_reasoner.ind_object_properties(anna)
```

In this example, *object_properties* contains all the object properties that *anna* has, which in our case would only be *hasChild*. Now we can get the individuals of this object property for *anna*.

```
for op in object_properties:
    object_properties_values = structural_reasoner.object_property_values(anna, op)
    for individual in object_properties_values:
        print(individual)
```

In this example we iterated over the *object_properties*, assuming that there are more than 1, and we use the reasoner to get the values for each object property *op* of the individual *anna*. The values are individuals which we store in the variable *object_properties_values* and are printed in the end. The method *object_property_values* requires as the first argument, an *OWLNamedIndividual* that is the subject of the object property values and the second argument an *OWLObjectProperty* whose values are to be retrieved for the specified individual.

NOTE: You can as well get all the data properties of an individual in the same way by using *ind_data_properties* instead of *ind_object_properties* and *data_property_values* instead of *object_property_values*. Keep in mind that *data_property_values* returns literal values (type of *OWLLiteral*).

In the same way as with classes, you can also get the sub object properties or equivalent object properties.

```

from owlapy.owl_property import OWLObjectProperty

hasChild = OWLObjectProperty(URI(namespace, "hasChild"))

equivalent_to_hasChild = structural_reasoner.equivalent_object_properties(hasChild)
hasChild_sub_properties = structural_reasoner.sub_object_properties(hasChild)

```

In case you want to get the domains and ranges of an object property use the following:

```

hasChild_domains = structural_reasoner.object_property_domains(hasChild)
hasChild_ranges = structural_reasoner.object_property_ranges(hasChild)

```

NOTE: Again, you can do the same for data properties but instead of the word ‘object’ in the method name you should use ‘data’.

4.4 Find Instances

The method `instances` is a very convenient method. It takes only 1 argument that is basically a class expression and returns all the individuals belonging to that class expression. In Owlapy we have implemented a Python class for each type of class expression. The argument is of type *OWLClassExpression*.

Let us now show a simple example by finding the instances of the class *male* and printing them:

```

male_individuals = structural_reasoner.instances(male)
for ind in male_individuals:
    print(ind)

```

In this guide we covered the main functionalities of the reasoners in Owlapy. In the next one, we speak about owlapi synchronization and how can make use of owlapi in owlapy.

5 Owlapi Synchronization

As mentioned earlier, *owlapy* is loosely based in *owlapi*¹⁶, a library for ontology modification in java.

We have created *OWLAPIMapper*, a mapping class that makes possible the conversion of the most important classes from *owlapy* to *owlapi* and vice-versa.

We are able to use owlapi via *Jpype*¹⁷, a python module that provides access to Java in python. To start executing Java code via Jpype, one needs to start the java virtual machine (JVM). You don’t have to worry about it, because if a class is going to use *OWLAPIMapper* the JVM will start automatically. However, there is the function `startJVM` of the `static_functions.py` module if you ever need to start it manually.

5.1 “Sync” Classes

With the addition of the *OWLAPIMapper*, we introduce three new classes:

- *SyncOntologyManager*
- *SyncOntology*
- *SyncReasoner*

¹⁶ <https://github.com/owlcs/owlapi>

¹⁷ <https://jpype.readthedocs.io/en/latest/>

All the logic of these three classes is handled by *owlapi* through the mapper. They inherit from abstract classes already present in owlapy (OWLontologyManager, OWLontology and OWLReasoner respectively) so the usage is the same as other implementors of these abstract classes. However, there are also some extra methods, like `infer_axioms` of `SyncReasoner` which infers the missing axioms from the given ontology and returns them as `Iterable[OWLAxiom]`. Make sure to check the API docs to see them all.

To make this guide self-contained, we will go through a simple example showing how to use this above-mentioned classes:

```
from owlapy.owl_ontology_manager import SyncOntologyManager
from owlapy.owl_axiom import OWLDeclarationAxiom
from owlapy.class_expression import OWLClass
from owlapy.owl_reasoner import SyncReasoner
from owlapy.static_funcs import stopJVM

# (.) Create a manager and load the 'father' ontology
manager = SyncOntologyManager()
ontology = manager.load_ontology("KGs/Family/father.owl")

# (.) Use your ontology as you usually do
# (..) Add a new class
ontology.add_axiom(OWLDeclarationAxiom(OWLClass("http://example.com/father#some_new_
↪class"))))
# (..) Print classes in signature
[print(cls) for cls in ontology.classes_in_signature()]

# (.) Create a reasoner and perform some reasoning
reasoner = SyncReasoner(ontology)

# (..) Check ontology consistency
print(f"Is the ontology consistent? Answer: {reasoner.has_consistent_ontology()}")

# (..) Print all male individuals
[print(ind) for ind in reasoner.instances(OWLClass("http://example.com/father#male"))]

# (.) Stop the JVM if you no longer intend to use "Sync" classes
stopJVM()
```

This was a simple example using the *'father'* ontology to show just a small part of what you can do with “Sync” classes.

Notice that after we are done using them we can stop the JVM by either using `jpyype.shutdownJVM()` or the static function from the `static_functions.py` module `stopJVM()`. This will free the resources used by JPyype and the java packages. Once you stop the JVM it cannot be restarted so make sure you do that when you are done with the owlapi related classes. Stopping the JVM is not strictly necessary. The resources will be freed once the execution is over, but in case your code is somehow longer and the “Sync” classes only make up a part of your execution then you can stop the JVM after it not being needed anymore.

5.2 Notes

An important thing to keep in mind is that when starting the JVM you are able to import and use java classes as you would do in python (thanks to Jpyype). That means that you can play around with owlapi code in python as long as your JVM is started. Isn't that awesome!

`SyncReasoner` uses `HermiT` reasoner by default. You can choose between: “HermiT”, “Pellet”, “JFact” and “Openllet”. Although no significant difference is noticed between these reasoners, they surely differentiate in specific scenarios. You

can check owlapi Wiki¹⁸ for more references.

owlapi version: 5.1.9

5.3 Examples

You can see usage examples in the *examples*¹⁹ folder.

Test cases²⁰ can also serve as an example, so you can check them out as well.

6 Further Resources

Currently, we are working on our manuscript describing our framework. If you want to attribute our library, please use our GitHub page²¹ for reference.

6.1 More Inside the Project

Examples and test cases provide a good starting point to get to know the project better. Find them in the folders *examples*²² and *tests*²³.

6.2 Contribution

Feel free to create a pull request and we will take a look on it. Your commitment is well appreciated!

6.3 Questions

In case you have any question, please contact: caglardemir8@gmail.com or open an issue on our GitHub issues page²⁴.

6.4 Coverage Report

The coverage report is generated using *coverage.py*²⁵.

7.1 Submodules

owlapy.abstracts

Submodules

owlapy.abstracts.abstract_owl_ontology

Classes

AbstractOWLontology

Represents an OWL 2 Ontology in the OWL 2 specification.

Module Contents

class owlapy.abstracts.abstract_owl_ontology.**AbstractOWLontology**

Bases: *owlapy.owl_object.OWLObject*

Represents an OWL 2 Ontology in the OWL 2 specification.

An OWLontology consists of a possibly empty set of OWLaxioms and a possibly empty set of OWLAnnotations. An ontology can have an ontology IRI which can be used to identify the ontology. If it has an ontology IRI then it may also have an ontology version IRI. Since OWL 2, an ontology need not have an ontology IRI. (See the OWL 2 Structural Specification).

An ontology cannot be modified directly. Changes must be applied via its OWLontologyManager.

__slots__ = ()

type_index: Final = 1

abstract classes_in_signature () → Iterable[*owlapy.class_expression.OWLClass*]

Gets the classes in the signature of this object.

Returns

Classes in the signature of this object.

abstract data_properties_in_signature () → Iterable[*owlapy.owl_property.OWLDataProperty*]

Get the data properties that are in the signature of this object.

Returns

Data properties that are in the signature of this object.

abstract object_properties_in_signature ()
→ Iterable[*owlapy.owl_property.OWLObjectProperty*]

A convenience method that obtains the object properties that are in the signature of this object.

Returns

Object properties that are in the signature of this object.

abstract individuals_in_signature () → Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

A convenience method that obtains the individuals that are in the signature of this object.

Returns

Individuals that are in the signature of this object.

abstract equivalent_classes_axioms (c: owlapy.class_expression.OWLClass)
→ Iterable[*owlapy.owl_axiom.OWLEquivalentClassesAxiom*]

Gets all of the equivalent axioms in this ontology that contain the specified class as an operand.

Parameters

c – The class for which the EquivalentClasses axioms should be retrieved.

Returns

EquivalentClasses axioms contained in this ontology.

abstract general_class_axioms () → Iterable[*owlapy.owl_axiom.OWLClassAxiom*]

Get the general class axioms of this ontology. This includes SubClass axioms with a complex class expression

as the sub class and EquivalentClass axioms and DisjointClass axioms with only complex class expressions.

Returns

General class axioms contained in this ontology.

abstract data_property_domain_axioms (property: owlapy.owl_property.OWLDataProperty)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyDomainAxiom*]

Gets the OWLDataPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

abstract data_property_range_axioms (property: owlapy.owl_property.OWLDataProperty)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyRangeAxiom*]

Gets the OWLDataPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract object_property_domain_axioms (property: owlapy.owl_property.OWLObjectProperty)
    → Iterable[owlapy.owl_axiom.OWLObjectPropertyDomainAxiom]
```

Gets the OWLObjectPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract object_property_range_axioms (property: owlapy.owl_property.OWLObjectProperty)
    → Iterable[owlapy.owl_axiom.OWLObjectPropertyRangeAxiom]
```

Gets the OWLObjectPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract get_owl_ontology_manager () → _M
```

Gets the manager that manages this ontology.

```
abstract get_ontology_id () → _OI
```

Gets the OWLOntologyID belonging to this object.

Returns

The OWLOntologyID.

```
is_anonymous () → bool
```

Check whether this ontology does contain an IRI or not.

```
abstract add_axiom (
    axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom])
```

Add the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

```
abstract remove_axiom (
    axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom])
```

Removes the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

```
abstract save (document_iri: owlapy.iri.IRI | None = None)
```

Saves this ontology, using its IRI to determine where/how the ontology should be saved.

Parameters

document_iri – Whether you want to save in a different location.

owlapy.abstracts.abstract_owl_ontology_manager

Classes

<i>AbstractOWLontologyChange</i>	Represents an ontology change.
<i>AbstractOWLontologyManager</i>	An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing

Module Contents

```
class owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyChange(  
    ontology: owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology)
```

Represents an ontology change.

```
__slots__ = ()
```

```
get_ontology() → owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology
```

Gets the ontology that the change is/was applied to.

Returns

The ontology that the change is applicable to.

```
class owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyManager
```

An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing ontologies.

```
abstract create_ontology(iri: str | owlapy.iri.IRI)  
    → owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology
```

Creates a new (empty) ontology that that has the specified ontology IRI (and no version IRI).

Parameters

iri – The IRI of the ontology to be created, can also be a string.

Returns

The newly created ontology.

```
abstract load_ontology(iri: owlapy.iri.IRI | str)  
    → owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology
```

Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology IRI will be mapped to an ontology document IRI.

Parameters

iri –

The IRI that identifies the ontology, can also be a string.

It is expected that the ontology will also have this IRI

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

abstract apply_change (*change*: *AbstractOWLontologyChange*)

A convenience method that applies just one change to an ontology. When this method is used through an *OWLontologyManager* implementation, the instance used should be the one that the ontology returns through the *get_owl_ontology_manager()* call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

owlapy.abstracts.abstract_owl_reasoner

OWL Reasoner

Attributes

logger

Classes

AbstractOWLReasoner

An *OWLReasoner* reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of

Module Contents

owlapy.abstracts.abstract_owl_reasoner.**logger**

class owlapy.abstracts.abstract_owl_reasoner.**AbstractOWLReasoner** (
 ontology: owlapy.abstracts.abstract_owl_ontology.*AbstractOWLontology*)

An *OWLReasoner* reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of a particular ontology - the “root” ontology.

__slots__ = ()

abstract data_property_domains (*pe*: owlapy.owl_property.*OWLDataProperty*,
 direct: bool = False) → Iterable[owlapy.class_expression.*OWLClassExpression*]

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let *N* = *equivalent_classes*(*DataSomeValuesFrom*(*pe* *rdfs:Literal*)). If *direct* is True: then if *N* is not empty then the return value is *N*, else the return value is the result of *super_classes*(*DataSomeValuesFrom*(*pe* *rdfs:Literal*), true). If *direct* is False: then the result of

super_classes(DataSomeValuesFrom(pe rdfs:Literal), false) together with N if N is non-empty.
(Note, rdfs:Literal is the top datatype).

abstract object_property_domains (pe: *owlapy.owl_property.OWLObjectProperty*,
direct: bool = False) → Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let N = equivalent_classes(ObjectSomeValuesFrom(pe owl:Thing)). If direct is True: then if N is not empty then the return value is N, else the return value is the result of super_classes(ObjectSomeValuesFrom(pe owl:Thing), true). If direct is False: then the result of super_classes(ObjectSomeValuesFrom(pe owl:Thing), false) together with N if N is non-empty.

abstract object_property_ranges (pe: *owlapy.owl_property.OWLObjectProperty*,
direct: bool = False) → Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns

Let N = equivalent_classes(ObjectSomeValuesFrom(ObjectInverseOf(pe) owl:Thing)). If direct is True: then if N is not empty then the return value is N, else the return value is the result of super_classes(ObjectSomeValuesFrom(ObjectInverseOf(pe) owl:Thing), true). If direct is False: then the result of super_classes(ObjectSomeValuesFrom(ObjectInverseOf(pe) owl:Thing), false) together with N if N is non-empty.

abstract equivalent_classes (ce: *owlapy.class_expression.OWLClassExpression*)
→ Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are equivalent to the specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose equivalent classes are to be retrieved.

Returns

All class expressions C where the root ontology imports closure entails EquivalentClasses(ce C). If ce is not a class name (i.e. it is an anonymous class expression) and there are no such classes C then there will be no result. If ce is unsatisfiable with respect to the set of reasoner axioms then owl:Nothing, i.e. the bottom node, will be returned.

abstract disjoint_classes (*ce*: *owlapy.class_expression.OWLClassExpression*)
→ Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are disjoint with specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose disjoint classes are to be retrieved.

Returns

All class expressions D where the set of reasoner axioms entails EquivalentClasses(D ObjectComplementOf(ce)) or StrictSubClassOf(D ObjectComplementOf(ce)).

abstract different_individuals (*ind*: *owlapy.owl_individual.OWLNamedIndividual*)
→ Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

Gets the individuals that are different from the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose different individuals are to be retrieved.

Returns

All individuals x where the set of reasoner axioms entails DifferentIndividuals(ind x).

abstract same_individuals (*ind*: *owlapy.owl_individual.OWLNamedIndividual*)
→ Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

Gets the individuals that are the same as the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose same individuals are to be retrieved.

Returns

All individuals x where the root ontology imports closure entails SameIndividual(ind x).

abstract equivalent_object_properties (
op: *owlapy.owl_property.OWLObjectPropertyExpression*)
→ Iterable[*owlapy.owl_property.OWLObjectPropertyExpression*]

Gets the simplified object properties that are equivalent to the specified object property with respect to the set of reasoner axioms.

Parameters

op – The object property whose equivalent object properties are to be retrieved.

Returns

All simplified object properties e where the root ontology imports closure entails EquivalentObjectProperties(op e). If op is unsatisfiable with respect to the set of reasoner axioms then owl:bottomDataProperty will be returned.

abstract equivalent_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_property.OWLDataProperty*]

Gets the data properties that are equivalent to the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose equivalent data properties are to be retrieved.

Returns

All data properties e where the root ontology imports closure entails EquivalentDataProperties(dp e). If dp is unsatisfiable with respect to the set of reasoner axioms then owl:bottomDataProperty will be returned.

abstract data_property_values (*e*: owlapy.owl_object.OWLEntity,
pe: owlapy.owl_property.OWLDataProperty) → Iterable[owlapy.owl_literal.OWLLiteral]

Gets the data property values for the specified entity and data property expression.

Parameters

- **e** – The owl entity (usually an individual) that is the subject of the data property values.
- **pe** – The data property expression whose values are to be retrieved for the specified entity.

Note: Can be used to get values, for example, of ‘label’ property of owl entities such as classes and properties too (not only individuals).

Returns

A set of OWLLiterals containing literals such that for each literal *l* in the set, the set of reasoner axioms entails DataPropertyAssertion(*pe* ind *l*).

abstract object_property_values (*ind*: owlapy.owl_individual.OWLNamedIndividual,
pe: owlapy.owl_property.OWLObjectPropertyExpression)
→ Iterable[owlapy.owl_individual.OWLNamedIndividual]

Gets the object property values for the specified individual and object property expression.

Parameters

- **ind** – The individual that is the subject of the object property values.
- **pe** – The object property expression whose values are to be retrieved for the specified individual.

Returns

The named individuals such that for each individual *j*, the set of reasoner axioms entails ObjectPropertyAssertion(*pe* ind *j*).

abstract instances (*ce*: owlapy.class_expression.OWLClassExpression, *direct*: bool = False,
timeout: int = 1000) → Iterable[owlapy.owl_individual.OWLNamedIndividual]

Gets the individuals which are instances of the specified class expression.

Parameters

- **ce** – The class expression whose instances are to be retrieved.
- **direct** – Specifies if the direct instances should be retrieved (True), or if all instances should be retrieved (False).
- **timeout** – Time limit in seconds until results must be returned, else empty set is returned.

Returns

If *direct* is True, each named individual *j* where the set of reasoner axioms entails DirectClassAssertion(*ce*, *j*). If *direct* is False, each named individual *j* where the set of reasoner axioms entails ClassAssertion(*ce*, *j*). If *ce* is unsatisfiable with respect to the set of reasoner axioms then nothing returned.

abstract sub_classes (*ce*: owlapy.class_expression.OWLClassExpression, *direct*: bool = False)
→ Iterable[owlapy.class_expression.OWLClassExpression]

Gets the set of named classes that are the strict (potentially direct) subclasses of the specified class expression with respect to the reasoner axioms.

Parameters

- **ce** – The class expression whose strict (direct) subclasses are to be retrieved.
- **direct** – Specifies if the direct subclasses should be retrieved (True) or if the all subclasses (descendant) classes should be retrieved (False).

Returns

If direct is True, each class C where reasoner axioms entails DirectSubClassOf(C, ce). If direct is False, each class C where reasoner axioms entails StrictSubClassOf(C, ce). If ce is equivalent to owl:Nothing then nothing will be returned.

abstract disjoint_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*)
→ Iterable[*owlapy.owl_property.OWLObjectPropertyExpression*]

Gets the simplified object properties that are disjoint with the specified object property with respect to the set of reasoner axioms.

Parameters

op – The object property whose disjoint object properties are to be retrieved.

Returns

All simplified object properties e where the root ontology imports closure entails EquivalentObjectProperties(e ObjectPropertyComplementOf(op)) or StrictSubObjectPropertyOf(e ObjectPropertyComplementOf(op)).

abstract disjoint_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_property.OWLDataProperty*]

Gets the data properties that are disjoint with the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose disjoint data properties are to be retrieved.

Returns

All data properties e where the root ontology imports closure entails EquivalentDataProperties(e DataPropertyComplementOf(dp)) or StrictSubDataPropertyOf(e DataPropertyComplementOf(dp)).

abstract sub_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*, *direct*: *bool = False*)
→ Iterable[*owlapy.owl_property.OWLDataProperty*]

Gets the set of named data properties that are the strict (potentially direct) subproperties of the specified data property expression with respect to the imports closure of the root ontology.

Parameters

- **dp** – The data property whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If direct is True, each property P where the set of reasoner axioms entails DirectSubDataPropertyOf(P, pe). If direct is False, each property P where the set of reasoner axioms entails StrictSubDataPropertyOf(P, pe). If pe is equivalent to owl:bottomDataProperty then nothing will be returned.

abstract super_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*,
direct: *bool = False*) → Iterable[*owlapy.owl_property.OWLDataProperty*]

Gets the stream of data properties that are the strict (potentially direct) super properties of the specified data property with respect to the imports closure of the root ontology.

Parameters

- **dp** (*OWLDataProperty*) – The data property whose super properties are to be retrieved.
- **direct** (*bool*) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

abstract sub_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*,
direct: *bool* = *False*) → *Iterable[owlapy.owl_property.OWLObjectPropertyExpression]*

Gets the stream of simplified object property expressions that are the strict (potentially direct) subproperties of the specified object property expression with respect to the imports closure of the root ontology.

Parameters

- **op** – The object property expression whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If **direct** is True, simplified object property expressions, such that for each simplified object property expression, P, the set of reasoner axioms entails *DirectSubObjectPropertyOf*(P, pe). If **direct** is False, simplified object property expressions, such that for each simplified object property expression, P, the set of reasoner axioms entails *StrictSubObjectPropertyOf*(P, pe). If pe is equivalent to *owl:bottomObjectProperty* then nothing will be returned.

abstract super_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*,
direct: *bool* = *False*) → *Iterable[owlapy.owl_property.OWLObjectPropertyExpression]*

Gets the stream of object properties that are the strict (potentially direct) super properties of the specified object property with respect to the imports closure of the root ontology.

Parameters

- **op** (*OWLObjectPropertyExpression*) – The object property expression whose super properties are to be retrieved.
- **direct** (*bool*) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

abstract types (*ind*: *owlapy.owl_individual.OWLNamedIndividual*, *direct*: *bool* = *False*)
→ *Iterable[owlapy.class_expression.OWLClass]*

Gets the named classes which are (potentially direct) types of the specified named individual.

Parameters

- **ind** – The individual whose types are to be retrieved.
- **direct** – Specifies if the direct types should be retrieved (True), or if all types should be retrieved (False).

Returns

If **direct** is True, each named class C where the set of reasoner axioms entails *DirectClassAssertion*(C, ind). If **direct** is False, each named class C where the set of reasoner axioms entails *ClassAssertion*(C, ind).

abstract get_root_ontology () → *owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology*

Gets the “root” ontology that is loaded into this reasoner. The reasoner takes into account the axioms in this ontology and its import’s closure.

abstract super_classes (*ce*: *owlapy.class_expression.OWLClassExpression*, *direct*: *bool* = *False*)
→ *Iterable[owlapy.class_expression.OWLClassExpression]*

Gets the stream of named classes that are the strict (potentially direct) super classes of the specified class expression with respect to the imports closure of the root ontology.

Parameters

- **ce** – The class expression whose strict (direct) super classes are to be retrieved.
- **direct** – Specifies if the direct super classes should be retrieved (True) or if the all super classes (ancestors) classes should be retrieved (False).

Returns

If direct is True, each class C where the set of reasoner axioms entails `DirectSubClassOf(ce, C)`. If direct is False, each class C where set of reasoner axioms entails `StrictSubClassOf(ce, C)`. If ce is equivalent to `owl:Thing` then nothing will be returned.

data_property_ranges (*pe: owlapy.owl_property.OWLDataProperty, direct: bool = False*)
→ `Iterable[owlapy.owl_data_ranges.OWLDataRange]`

Gets the data ranges that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns:

all_data_property_values (*pe: owlapy.owl_property.OWLDataProperty, direct: bool = True*)
→ `Iterable[owlapy.owl_literal.OWLLiteral]`

Gets all values for the given data property expression that appear in the knowledge base.

Parameters

- **pe** – The data property expression whose values are to be retrieved
- **direct** – Specifies if only the direct values of the data property pe should be retrieved (True), or if the values of sub properties of pe should be taken into account (False).

Returns

A set of OWLLiterals containing literals such that for each literal l in the set, the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)` for any ind.

ind_data_properties (*ind: owlapy.owl_individual.OWLNamedIndividual, direct: bool = True*)
→ `Iterable[owlapy.owl_property.OWLDataProperty]`

Gets all data properties for the given individual that appear in the knowledge base.

Parameters

- **ind** – The named individual whose data properties are to be retrieved
- **direct** – Specifies if the direct data properties should be retrieved (True), or if all data properties should be retrieved (False), so that sub properties are taken into account.

Returns

All data properties pe where the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)` for atleast one l.

ind_object_properties (*ind: owlapy.owl_individual.OWLNamedIndividual, direct: bool = True*)
→ `Iterable[owlapy.owl_property.OWLObjectProperty]`

Gets all object properties for the given individual that appear in the knowledge base.

Parameters

- **ind** – The named individual whose object properties are to be retrieved

- **direct** – Specifies if the direct object properties should be retrieved (True), or if all object properties should be retrieved (False), so that sub properties are taken into account.

Returns

All data properties *pe* where the set of reasoner axioms entails `ObjectPropertyAssertion(pe ind ind2)` for atleast one *ind2*.

Classes

<i>AbstractOWLOntologyManager</i>	An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing
<i>AbstractOWLOntologyChange</i>	Represents an ontology change.
<i>AbstractOWLOntology</i>	Represents an OWL 2 Ontology in the OWL 2 specification.
<i>AbstractOWLReasoner</i>	An OWLReasoner reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of

Package Contents

class owlapy.abstracts.**AbstractOWLOntologyManager**

An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing ontologies.

abstract `create_ontology(iri: str | owlapy.iri.IRI)`
→ `owlapy.abstracts.abstract_owl_ontology.AbstractOWLOntology`

Creates a new (empty) ontology that has the specified ontology IRI (and no version IRI).

Parameters

iri – The IRI of the ontology to be created, can also be a string.

Returns

The newly created ontology.

abstract `load_ontology(iri: owlapy.iri.IRI | str)`
→ `owlapy.abstracts.abstract_owl_ontology.AbstractOWLOntology`

Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology IRI will be mapped to an ontology document IRI.

Parameters

iri –

The IRI that identifies the ontology, can also be a string.

It is expected that the ontology will also have this IRI

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

abstract `apply_change(change: AbstractOWLOntologyChange)`

A convenience method that applies just one change to an ontology. When this method is used through an OWLOntologyManager implementation, the instance used should be the one that the ontology returns through the `get_owl_ontology_manager()` call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

```
class owlapy.abstracts.AbstractOWLontologyChange (
    ontology: owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology)
    Represents an ontology change.

    __slots__ = ()

    get_ontology() → owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology
        Gets the ontology that the change is/was applied to.
```

Returns

The ontology that the change is applicable to.

```
class owlapy.abstracts.AbstractOWLontology
    Bases: owlapy.owl_object.OWLObject

    Represents an OWL 2 Ontology in the OWL 2 specification.

    An OWLontology consists of a possibly empty set of OWLAxioms and a possibly empty set of OWLAnnotations.
    An ontology can have an ontology IRI which can be used to identify the ontology. If it has an ontology IRI then it
    may also have an ontology version IRI. Since OWL 2, an ontology need not have an ontology IRI. (See the OWL
    2 Structural Specification).
```

An ontology cannot be modified directly. Changes must be applied via its OWLontologyManager.

```
__slots__ = ()

type_index: Final = 1

abstract classes_in_signature() → Iterable[owlapy.class_expression.OWLClass]
    Gets the classes in the signature of this object.
```

Returns

Classes in the signature of this object.

```
abstract data_properties_in_signature() → Iterable[owlapy.owl_property.OWLDataProperty]
    Get the data properties that are in the signature of this object.
```

Returns

Data properties that are in the signature of this object.

```
abstract object_properties_in_signature()
    → Iterable[owlapy.owl_property.OWLObjectProperty]
    A convenience method that obtains the object properties that are in the signature of this object.
```

Returns

Object properties that are in the signature of this object.

```
abstract individuals_in_signature() → Iterable[owlapy.owl_individual.OWLNamedIndividual]
    A convenience method that obtains the individuals that are in the signature of this object.
```

Returns

Individuals that are in the signature of this object.

```
abstract equivalent_classes_axioms(c: owlapy.class_expression.OWLClass)
    → Iterable[owlapy.owl_axiom.OWLEquivalentClassesAxiom]
    Gets all of the equivalent axioms in this ontology that contain the specified class as an operand.
```

Parameters

c – The class for which the EquivalentClasses axioms should be retrieved.

Returns

EquivalentClasses axioms contained in this ontology.

abstract general_class_axioms () → Iterable[*owlapy.owl_axiom.OWLClassAxiom*]

Get the general class axioms of this ontology. This includes SubClass axioms with a complex class expression

as the sub class and EquivalentClass axioms and DisjointClass axioms with only complex class expressions.

Returns

General class axioms contained in this ontology.

abstract data_property_domain_axioms (*property: owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyDomainAxiom*]

Gets the OWLDataPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

abstract data_property_range_axioms (*property: owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyRangeAxiom*]

Gets the OWLDataPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

abstract object_property_domain_axioms (*property: owlapy.owl_property.OWLObjectProperty*)
→ Iterable[*owlapy.owl_axiom.OWLObjectPropertyDomainAxiom*]

Gets the OWLObjectPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

abstract object_property_range_axioms (*property: owlapy.owl_property.OWLObjectProperty*)
→ Iterable[*owlapy.owl_axiom.OWLObjectPropertyRangeAxiom*]

Gets the OWLObjectPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

abstract get_owl_ontology_manager () → *_M*

Gets the manager that manages this ontology.

abstract get_ontology_id () → *_OI*

Gets the OWLOntologyID belonging to this object.

Returns

The OWLOntologyID.

is_anonymous () → bool

Check whether this ontology does contain an IRI or not.

abstract add_axiom (
 axiom: owlapy.owl_axiom.OWLXiom | Iterable[owlapy.owl_axiom.OWLXiom])

Add the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

abstract remove_axiom (
 axiom: owlapy.owl_axiom.OWLXiom | Iterable[owlapy.owl_axiom.OWLXiom])

Removes the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

abstract save (*document_iri: owlapy.iri.IRI | None = None*)

Saves this ontology, using its IRI to determine where/how the ontology should be saved.

Parameters

document_iri – Whether you want to save in a different location.

class owlapy.abstracts.AbstractOWLReasoner (
 ontology: owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology)

An OWLReasoner reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of a particular ontology - the “root” ontology.

__slots__ = ()

abstract data_property_domains (*pe: owlapy.owl_property.OWLDataProperty,*
 direct: bool = False) → *Iterable[owlapy.class_expression.OWLClassExpression]*

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let N = `equivalent_classes(DataSomeValuesFrom(pe rdfs:Literal))`. If `direct` is True: then if N is not empty then the return value is N, else the return value is the result of `super_classes(DataSomeValuesFrom(pe rdfs:Literal), true)`. If `direct` is False: then the result of `super_classes(DataSomeValuesFrom(pe rdfs:Literal), false)` together with N if N is non-empty. (Note, `rdfs:Literal` is the top datatype).

abstract object_property_domains (*pe: owlapy.owl_property.OWLObjectProperty,*
 direct: bool = False) → *Iterable[owlapy.class_expression.OWLClassExpression]*

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let $N = \text{equivalent_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}))$. If **direct** is True: then if N is not empty then the return value is N , else the return value is the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}), \text{true})$. If **direct** is False: then the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}), \text{false})$ together with N if N is non-empty.

```
abstract object_property_ranges (pe: owlapy.owl_property.OWLObjectProperty,  
direct: bool = False) → Iterable[owlapy.class_expression.OWLClassExpression]
```

Gets the class expressions that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns

Let $N = \text{equivalent_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})))$. If **direct** is True: then if N is not empty then the return value is N , else the return value is the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})), \text{true})$. If **direct** is False: then the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})), \text{false})$ together with N if N is non-empty.

```
abstract equivalent_classes (ce: owlapy.class_expression.OWLClassExpression)  
→ Iterable[owlapy.class_expression.OWLClassExpression]
```

Gets the class expressions that are equivalent to the specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose equivalent classes are to be retrieved.

Returns

All class expressions C where the root ontology imports closure entails $\text{EquivalentClasses}(ce\ C)$. If ce is not a class name (i.e. it is an anonymous class expression) and there are no such classes C then there will be no result. If ce is unsatisfiable with respect to the set of reasoner axioms then owl:Nothing , i.e. the bottom node, will be returned.

```
abstract disjoint_classes (ce: owlapy.class_expression.OWLClassExpression)  
→ Iterable[owlapy.class_expression.OWLClassExpression]
```

Gets the class expressions that are disjoint with specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose disjoint classes are to be retrieved.

Returns

All class expressions D where the set of reasoner axioms entails `EquivalentClasses(D ObjectComplementOf(ce))` or `StrictSubClassOf(D ObjectComplementOf(ce))`.

abstract different_individuals (*ind*: *owlapy.owl_individual.OWLNamedIndividual*)
→ *Iterable[owlapy.owl_individual.OWLNamedIndividual]*

Gets the individuals that are different from the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose different individuals are to be retrieved.

Returns

All individuals x where the set of reasoner axioms entails `DifferentIndividuals(ind x)`.

abstract same_individuals (*ind*: *owlapy.owl_individual.OWLNamedIndividual*)
→ *Iterable[owlapy.owl_individual.OWLNamedIndividual]*

Gets the individuals that are the same as the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose same individuals are to be retrieved.

Returns

All individuals x where the root ontology imports closure entails `SameIndividual(ind x)`.

abstract equivalent_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*)
→ *Iterable[owlapy.owl_property.OWLObjectPropertyExpression]*

Gets the simplified object properties that are equivalent to the specified object property with respect to the set of reasoner axioms.

Parameters

op – The object property whose equivalent object properties are to be retrieved.

Returns

All simplified object properties e where the root ontology imports closure entails `EquivalentObjectProperties(op e)`. If op is unsatisfiable with respect to the set of reasoner axioms then `owl:bottomDataProperty` will be returned.

abstract equivalent_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*)
→ *Iterable[owlapy.owl_property.OWLDataProperty]*

Gets the data properties that are equivalent to the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose equivalent data properties are to be retrieved.

Returns

All data properties e where the root ontology imports closure entails `EquivalentDataProperties(dp e)`. If dp is unsatisfiable with respect to the set of reasoner axioms then `owl:bottomDataProperty` will be returned.

abstract data_property_values (*e*: *owlapy.owl_object.OWLEntity*,
pe: *owlapy.owl_property.OWLDataProperty*) → *Iterable[owlapy.owl_literal.OWLLiteral]*

Gets the data property values for the specified entity and data property expression.

Parameters

- **e** – The owl entity (usually an individual) that is the subject of the data property values.
- **pe** – The data property expression whose values are to be retrieved for the specified entity.

Note: Can be used to get values, for example, of 'label' property of owl entities such as classes and properties too (not only individuals).

Returns

A set of OWLLiterals containing literals such that for each literal *l* in the set, the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)`.

```
abstract object_property_values (ind: owlapy.owl_individual.OWLNamedIndividual,  
    pe: owlapy.owl_property.OWLObjectPropertyExpression)  
    → Iterable[owlapy.owl_individual.OWLNamedIndividual]
```

Gets the object property values for the specified individual and object property expression.

Parameters

- **ind** – The individual that is the subject of the object property values.
- **pe** – The object property expression whose values are to be retrieved for the specified individual.

Returns

The named individuals such that for each individual *j*, the set of reasoner axioms entails `ObjectPropertyAssertion(pe ind j)`.

```
abstract instances (ce: owlapy.class_expression.OWLClassExpression, direct: bool = False,  
    timeout: int = 1000) → Iterable[owlapy.owl_individual.OWLNamedIndividual]
```

Gets the individuals which are instances of the specified class expression.

Parameters

- **ce** – The class expression whose instances are to be retrieved.
- **direct** – Specifies if the direct instances should be retrieved (True), or if all instances should be retrieved (False).
- **timeout** – Time limit in seconds until results must be returned, else empty set is returned.

Returns

If **direct** is True, each named individual *j* where the set of reasoner axioms entails `DirectClassAssertion(ce, j)`. If **direct** is False, each named individual *j* where the set of reasoner axioms entails `ClassAssertion(ce, j)`. If *ce* is unsatisfiable with respect to the set of reasoner axioms then nothing returned.

```
abstract sub_classes (ce: owlapy.class_expression.OWLClassExpression, direct: bool = False)  
    → Iterable[owlapy.class_expression.OWLClassExpression]
```

Gets the set of named classes that are the strict (potentially direct) subclasses of the specified class expression with respect to the reasoner axioms.

Parameters

- **ce** – The class expression whose strict (direct) subclasses are to be retrieved.
- **direct** – Specifies if the direct subclasses should be retrieved (True) or if the all subclasses (descendant) classes should be retrieved (False).

Returns

If **direct** is True, each class *C* where reasoner axioms entails `DirectSubClassOf(C, ce)`. If **direct** is False, each class *C* where reasoner axioms entails `StrictSubClassOf(C, ce)`. If *ce* is equivalent to `owl:Nothing` then nothing will be returned.

```
abstract disjoint_object_properties (op: owlapy.owl_property.OWLObjectPropertyExpression)  
    → Iterable[owlapy.owl_property.OWLObjectPropertyExpression]
```

Gets the simplified object properties that are disjoint with the specified object property with respect to the set of reasoner axioms.

Parameters

op – The object property whose disjoint object properties are to be retrieved.

Returns

All simplified object properties *e* where the root ontology imports closure entails `EquivalentObjectProperties(e ObjectPropertyComplementOf(op))` or `StrictSubObjectPropertyOf(e ObjectPropertyComplementOf(op))`.

```
abstract disjoint_data_properties (dp: owlapy.owl_property.OWLDataProperty)
    → Iterable[owlapy.owl_property.OWLDataProperty]
```

Gets the data properties that are disjoint with the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose disjoint data properties are to be retrieved.

Returns

All data properties *e* where the root ontology imports closure entails `EquivalentDataProperties(e DataPropertyComplementOf(dp))` or `StrictSubDataPropertyOf(e DataPropertyComplementOf(dp))`.

```
abstract sub_data_properties (dp: owlapy.owl_property.OWLDataProperty, direct: bool = False)
    → Iterable[owlapy.owl_property.OWLDataProperty]
```

Gets the set of named data properties that are the strict (potentially direct) subproperties of the specified data property expression with respect to the imports closure of the root ontology.

Parameters

- **dp** – The data property whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If **direct** is True, each property *P* where the set of reasoner axioms entails `DirectSubDataPropertyOf(P, pe)`. If **direct** is False, each property *P* where the set of reasoner axioms entails `StrictSubDataPropertyOf(P, pe)`. If *pe* is equivalent to `owl:bottomDataProperty` then nothing will be returned.

```
abstract super_data_properties (dp: owlapy.owl_property.OWLDataProperty,
    direct: bool = False) → Iterable[owlapy.owl_property.OWLDataProperty]
```

Gets the stream of data properties that are the strict (potentially direct) super properties of the specified data property with respect to the imports closure of the root ontology.

Parameters

- **dp** (`OWLDataProperty`) – The data property whose super properties are to be retrieved.
- **direct** (`bool`) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

```
abstract sub_object_properties (op: owlapy.owl_property.OWLObjectPropertyExpression,
    direct: bool = False) → Iterable[owlapy.owl_property.OWLObjectPropertyExpression]
```

Gets the stream of simplified object property expressions that are the strict (potentially direct) subproperties of the specified object property expression with respect to the imports closure of the root ontology.

Parameters

- **op** – The object property expression whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If **direct** is True, simplified object property expressions, such that for each simplified object property expression, P, the set of reasoner axioms entails `DirectSubObjectPropertyOf(P, pe)`. If **direct** is False, simplified object property expressions, such that for each simplified object property expression, P, the set of reasoner axioms entails `StrictSubObjectPropertyOf(P, pe)`. If `pe` is equivalent to `owl:bottomObjectProperty` then nothing will be returned.

abstract super_object_properties (*op: owlapy.owl_property.OWLObjectPropertyExpression, direct: bool = False*) → `Iterable[owlapy.owl_property.OWLObjectPropertyExpression]`

Gets the stream of object properties that are the strict (potentially direct) super properties of the specified object property with respect to the imports closure of the root ontology.

Parameters

- **op** (`OWLObjectPropertyExpression`) – The object property expression whose super properties are to be retrieved.
- **direct** (`bool`) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

abstract types (*ind: owlapy.owl_individual.OWLNamedIndividual, direct: bool = False*) → `Iterable[owlapy.class_expression.OWLClass]`

Gets the named classes which are (potentially direct) types of the specified named individual.

Parameters

- **ind** – The individual whose types are to be retrieved.
- **direct** – Specifies if the direct types should be retrieved (True), or if all types should be retrieved (False).

Returns

If **direct** is True, each named class C where the set of reasoner axioms entails `DirectClassAssertion(C, ind)`. If **direct** is False, each named class C where the set of reasoner axioms entails `ClassAssertion(C, ind)`.

abstract get_root_ontology () → `owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology`

Gets the “root” ontology that is loaded into this reasoner. The reasoner takes into account the axioms in this ontology and its import’s closure.

abstract super_classes (*ce: owlapy.class_expression.OWLClassExpression, direct: bool = False*) → `Iterable[owlapy.class_expression.OWLClassExpression]`

Gets the stream of named classes that are the strict (potentially direct) super classes of the specified class expression with respect to the imports closure of the root ontology.

Parameters

- **ce** – The class expression whose strict (direct) super classes are to be retrieved.

- **direct** – Specifies if the direct super classes should be retrieved (True) or if the all super classes (ancestors) classes should be retrieved (False).

Returns

If **direct** is True, each class C where the set of reasoner axioms entails `DirectSubClassOf(ce, C)`. If **direct** is False, each class C where set of reasoner axioms entails `StrictSubClassOf(ce, C)`. If **ce** is equivalent to `owl:Thing` then nothing will be returned.

data_property_ranges (*pe: owlapy.owl_property.OWLDataProperty, direct: bool = False*)
 → `Iterable[owlapy.owl_data_ranges.OWLDataRange]`

Gets the data ranges that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns:

all_data_property_values (*pe: owlapy.owl_property.OWLDataProperty, direct: bool = True*)
 → `Iterable[owlapy.owl_literal.OWLLiteral]`

Gets all values for the given data property expression that appear in the knowledge base.

Parameters

- **pe** – The data property expression whose values are to be retrieved
- **direct** – Specifies if only the direct values of the data property **pe** should be retrieved (True), or if the values of sub properties of **pe** should be taken into account (False).

Returns

A set of OWLLiterals containing literals such that for each literal **l** in the set, the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)` for any **ind**.

ind_data_properties (*ind: owlapy.owl_individual.OWLNamedIndividual, direct: bool = True*)
 → `Iterable[owlapy.owl_property.OWLDataProperty]`

Gets all data properties for the given individual that appear in the knowledge base.

Parameters

- **ind** – The named individual whose data properties are to be retrieved
- **direct** – Specifies if the direct data properties should be retrieved (True), or if all data properties should be retrieved (False), so that sub properties are taken into account.

Returns

All data properties **pe** where the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)` for atleast one **l**.

ind_object_properties (*ind: owlapy.owl_individual.OWLNamedIndividual, direct: bool = True*)
 → `Iterable[owlapy.owl_property.OWLObjectProperty]`

Gets all object properties for the given individual that appear in the knowledge base.

Parameters

- **ind** – The named individual whose object properties are to be retrieved
- **direct** – Specifies if the direct object properties should be retrieved (True), or if all object properties should be retrieved (False), so that sub properties are taken into account.

Returns

All data properties *pe* where the set of reasoner axioms entails `ObjectPropertyAssertion(pe ind ind2)` for atleast one *ind2*.

OWL Base Classes Expressions

Classes

<i>OWLClassExpression</i>	OWL Class expressions represent sets of individuals by formally specifying conditions on the individuals' properties;
<i>OWLAnonymousClassExpression</i>	A Class Expression which is not a named Class.
<i>OWLBooleanClassExpression</i>	Represent an anonymous boolean class expression.
<i>OWLObjectComplementOf</i>	Represents an <code>ObjectComplementOf</code> class expression in the OWL 2 Specification.

Module Contents

class `owlapy.class_expression.class_expression.OWLClassExpression`

Bases: `owlapy.owl_data_ranges.OWLPropertyRange`

OWL Class expressions represent sets of individuals by formally specifying conditions on the individuals' properties; individuals satisfying these conditions are said to be instances of the respective class expressions. In the structural specification of OWL 2, class expressions are represented by `ClassExpression`. (https://www.w3.org/TR/owl2-syntax/#Class_Expressions)

__slots__ = ()

abstract `is_owl_thing()` → bool

Determines if this expression is the built in class `owl:Thing`. This method does not determine if the class is equivalent to `owl:Thing`.

Returns

`Thing`.

Return type

True if this expression is owl

abstract is_owl_nothing() → bool

Determines if this expression is the built in class owl:Nothing. This method does not determine if the class is equivalent to owl:Nothing.

abstract get_object_complement_of() → *OWLObjectComplementOf*

Gets the object complement of this class expression.

Returns

A class expression that is the complement of this class expression.

abstract get_nnf() → *OWLClassExpression*

Gets the negation normal form of the complement of this expression.

Returns

A expression that represents the NNF of the complement of this expression.

class owlapy.class_expression.class_expression.**OWLAnonymousClassExpression**

Bases: *OWLClassExpression*

A Class Expression which is not a named Class.

is_owl_nothing() → bool

Determines if this expression is the built in class owl:Nothing. This method does not determine if the class is equivalent to owl:Nothing.

is_owl_thing() → bool

Determines if this expression is the built in class owl:Thing. This method does not determine if the class is equivalent to owl:Thing.

Returns

Thing.

Return type

True if this expression is owl

get_object_complement_of() → *OWLObjectComplementOf*

Gets the object complement of this class expression.

Returns

A class expression that is the complement of this class expression.

get_nnf() → *OWLClassExpression*

Gets the negation normal form of the complement of this expression.

Returns

A expression that represents the NNF of the complement of this expression.

class owlapy.class_expression.class_expression.**OWLBooleanClassExpression**

Bases: *OWLAnonymousClassExpression*

Represent an anonymous boolean class expression.

__slots__ = ()

class owlapy.class_expression.class_expression.**OWLObjectComplementOf**(
 op: OWLClassExpression)

Bases: *OWLBooleanClassExpression*, *owlapy.meta_classes.HasOperands[OWLClassExpression]*

Represents an ObjectComplementOf class expression in the OWL 2 Specification.

```

__slots__ = '_operand'

type_index: Final = 3003

get_operand() → OWLClassExpression

```

Returns
The wrapped expression.

```

operands() → Iterable[OWLClassExpression]

```

Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

Returns
The operands.

```

__repr__()

__eq__(other)

__hash__()

```

owlapy.class_expression.nary_boolean_expression

OWL nary boolean expressions

Classes

<i>OWLNaryBooleanClassExpression</i>	OWLNaryBooleanClassExpression.
<i>OWLObjectUnionOf</i>	A union class expression <code>ObjectUnionOf(CE1 ... CEn)</code> contains all individuals that are instances
<i>OWLObjectIntersectionOf</i>	An intersection class expression <code>ObjectIntersectionOf(CE1 ... CEn)</code> contains all individuals that are instances

Module Contents

```

class owlapy.class_expression.nary_boolean_expression.
    OWLNaryBooleanClassExpression (
        operands: Iterable[owlapy.class_expression.class_expression.OWLClassExpression])
    Bases:
        owlapy.class_expression.class_expression.OWLBooleanClassExpression,
        owlapy.meta_classes.HasOperands[owlapy.class_expression.class_expression.
            OWLClassExpression]
    OWLNaryBooleanClassExpression.
    __slots__ = ()
    operands() → Iterable[owlapy.class_expression.class_expression.OWLClassExpression]
        Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.
    Returns
        The operands.
    __repr__()
    __eq__(other)

```

`__hash__()`

```
class owlapy.class_expression.nary_boolean_expression.OWLObjectUnionOf(
    operands: Iterable[owlapy.class_expression.class_expression.OWLClassExpression])
```

Bases: *OWLNaryBooleanClassExpression*

A union class expression `ObjectUnionOf(CE1 ... CEn)` contains all individuals that are instances of at least one class expression `CEi` for $1 \leq i \leq n$. (https://www.w3.org/TR/owl2-syntax/#Union_of_Class_Expressions)

```
__slots__ = '_operands'
```

```
type_index: Final = 3002
```

```
class owlapy.class_expression.nary_boolean_expression.OWLObjectIntersectionOf(
    operands: Iterable[owlapy.class_expression.class_expression.OWLClassExpression])
```

Bases: *OWLNaryBooleanClassExpression*

An intersection class expression `ObjectIntersectionOf(CE1 ... CEn)` contains all individuals that are instances of all class expressions `CEi` for $1 \leq i \leq n$. (https://www.w3.org/TR/owl2-syntax/#Intersection_of_Class_Expressions)

```
__slots__ = '_operands'
```

```
type_index: Final = 3001
```

owlapy.class_expression.owl_class

OWL Class

Classes

<i>OWLClass</i>	An OWL 2 named Class. Classes can be understood as sets of individuals.
-----------------	---

Module Contents

```
class owlapy.class_expression.owl_class.OWLClass(iri: owlapy.iri.IRI | str)
```

Bases: *owlapy.class_expression.class_expression.OWLClassExpression*, *owlapy.owl_object.OWLEntity*

An OWL 2 named Class. Classes can be understood as sets of individuals. (<https://www.w3.org/TR/owl2-syntax/#Classes>)

```
__slots__ = ('_iri', '_is_nothing', '_is_thing')
```

```
type_index: Final = 1001
```

```
property iri: owlapy.iri.IRI
```

Gets the IRI of this object.

Returns

The IRI of this object.

```
property str
```

Gets the string representation of this object

Returns

The IRI as string

property reminder: `str`

The reminder of the IRI

is_owl_thing() → bool

Determines if this expression is the built in class owl:Thing. This method does not determine if the class is equivalent to owl:Thing.

Returns

Thing.

Return type

True if this expression is owl

is_owl_nothing() → bool

Determines if this expression is the built in class owl:Nothing. This method does not determine if the class is equivalent to owl:Nothing.

get_object_complement_of() → *owlapy.class_expression.class_expression.OWLObjectComplementOf*

Gets the object complement of this class expression.

Returns

A class expression that is the complement of this class expression.

get_nnf() → *OWLClass*

Gets the negation normal form of the complement of this expression.

Returns

A expression that represents the NNF of the complement of this expression.

owlapy.class_expression.restriction

OWL Restrictions

Attributes

Literals

Classes

<i>OWLRestriction</i>	Represents an Object Property Restriction or Data Property Restriction in the OWL 2 specification.
<i>OWLHasValueRestriction</i>	Represent a HasValue restriction in the OWL 2
<i>OWLObjectRestriction</i>	Represents an Object Property Restriction in the OWL 2 specification.
<i>OWLQuantifiedRestriction</i>	Represents a quantified restriction.
<i>OWLCardinalityRestriction</i>	Base interface for owl min and max cardinality restriction.
<i>OWLQuantifiedObjectRestriction</i>	Represents a quantified object restriction.
<i>OWLObjectCardinalityRestriction</i>	Represents Object Property Cardinality Restrictions in the OWL 2 specification.
<i>OWLObjectMinCardinality</i>	A minimum cardinality expression <i>ObjectMinCardinality</i> (<i>n</i> OPE CE) consists of a nonnegative integer <i>n</i> , an object
<i>OWLObjectMaxCardinality</i>	A maximum cardinality expression <i>ObjectMaxCardinality</i> (<i>n</i> OPE CE) consists of a nonnegative integer <i>n</i> , an object
<i>OWLObjectExactCardinality</i>	An exact cardinality expression <i>ObjectExactCardinality</i> (<i>n</i> OPE CE) consists of a nonnegative integer <i>n</i> , an object
<i>OWLObjectSomeValuesFrom</i>	An existential class expression <i>ObjectSomeValuesFrom</i> (OPE CE) consists of an object property expression OPE and
<i>OWLObjectAllValuesFrom</i>	A universal class expression <i>ObjectAllValuesFrom</i> (OPE CE) consists of an object property expression OPE and a
<i>OWLObjectHasSelf</i>	A self-restriction <i>ObjectHasSelf</i> (OPE) consists of an object property expression OPE,
<i>OWLObjectHasValue</i>	A has-value class expression <i>ObjectHasValue</i> (OPE <i>a</i>) consists of an object property expression OPE and an
<i>OWLObjectOneOf</i>	An enumeration of individuals <i>ObjectOneOf</i> (<i>a</i> ₁ ... <i>a</i> _{<i>n</i>}) contains exactly the individuals <i>a</i> _{<i>i</i>} with 1 ≤ <i>i</i> ≤ <i>n</i> .
<i>OWLDataRestriction</i>	Represents a Data Property Restriction.
<i>OWLQuantifiedDataRestriction</i>	Represents a quantified data restriction.
<i>OWLDataCardinalityRestriction</i>	Represents Data Property Cardinality Restrictions.
<i>OWLDataMinCardinality</i>	A minimum cardinality expression <i>DataMinCardinality</i> (<i>n</i> DPE DR) consists of a nonnegative integer <i>n</i> , a data
<i>OWLDataMaxCardinality</i>	A maximum cardinality expression <i>ObjectMaxCardinality</i> (<i>n</i> OPE CE) consists of a nonnegative integer <i>n</i> , an object
<i>OWLDataExactCardinality</i>	An exact cardinality expression <i>ObjectExactCardinality</i> (<i>n</i> OPE CE) consists of a nonnegative integer <i>n</i> , an
<i>OWLDataSomeValuesFrom</i>	An existential class expression <i>DataSomeValuesFrom</i> (DPE ₁ ... DPE _{<i>n</i>} DR) consists of <i>n</i> data property expressions
<i>OWLDataAllValuesFrom</i>	A universal class expression <i>DataAllValuesFrom</i> (DPE ₁ ... DPE _{<i>n</i>} DR) consists of <i>n</i> data property expressions DPE _{<i>i</i>} ,
<i>OWLDataHasValue</i>	A has-value class expression <i>DataHasValue</i> (DPE <i>l</i> _{<i>t</i>}) consists of a data property expression DPE and a literal <i>l</i> _{<i>t</i>} ,
<i>OWLDataOneOf</i>	An enumeration of literals <i>DataOneOf</i> (<i>l</i> _{<i>t</i>} ₁ ... <i>l</i> _{<i>t</i>} _{<i>n</i>}) contains exactly the explicitly specified literals <i>l</i> _{<i>t</i>} _{<i>i</i>} with
<i>OWLDatatypeRestriction</i>	A datatype restriction <i>DatatypeRestriction</i> (DT F ₁ <i>l</i> _{<i>t</i>} ₁ ... F _{<i>n</i>} <i>l</i> _{<i>t</i>} _{<i>n</i>}) consists of a unary datatype DT and <i>n</i> pairs
<i>OWLFacetRestriction</i>	A facet restriction is used to restrict a particular datatype.

Module Contents

`owlapy.class_expression.restriction.Literals`

class `owlapy.class_expression.restriction.OWLRestriction`

Bases: `owlapy.class_expression.class_expression.OWLAnonymousClassExpression`

Represents an Object Property Restriction or Data Property Restriction in the OWL 2 specification.

`__slots__ = ()`

abstract `get_property()` → `owlapy.owl_property.OWLPropertyExpression`

Returns

Property being restricted.

`is_data_restriction()` → bool

Determines if this is a data restriction.

Returns

True if this is a data restriction.

`is_object_restriction()` → bool

Determines if this is an object restriction.

Returns

True if this is an object restriction.

class `owlapy.class_expression.restriction.OWLHasValueRestriction(value: _T)`

Bases: `Generic[_T]`, `OWLRestriction`, `owlapy.meta_classes.HasFiller[_T]`

Represent a HasValue restriction in the OWL 2

Parameters

value – The value type `_T`.

`__slots__ = ()`

`__eq__(other)`

`__hash__()`

`get_filler()` → `_T`

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns

the value

class `owlapy.class_expression.restriction.OWLObjectRestriction`

Bases: `OWLRestriction`

Represents an Object Property Restriction in the OWL 2 specification.

`__slots__ = ()`

`is_object_restriction()` → bool

Determines if this is an object restriction.

Returns

True if this is an object restriction.

abstract `get_property()` \rightarrow *owlapy.owl_property.OWLObjectPropertyExpression*

Returns

Property being restricted.

class `owlapy.class_expression.restriction.OWLQuantifiedRestriction`

Bases: `Generic[_T]`, *OWLRestriction*, *owlapy.meta_classes.HasFiller[_T]*

Represents a quantified restriction.

Parameters

`_T` – value type

`__slots__` = ()

class `owlapy.class_expression.restriction.OWLCardinalityRestriction` (*cardinality: int*,
filler: _F)

Bases: `Generic[_F]`, *OWLQuantifiedRestriction[_F]*, *owlapy.meta_classes.HasCardinality*

Base interface for owl min and max cardinality restriction.

Parameters

`_F` – Type of filler.

`__slots__` = ()

get_cardinality() \rightarrow int

Gets the cardinality of a restriction.

Returns

The cardinality. A non-negative integer.

get_filler() \rightarrow `_F`

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns

the value

class `owlapy.class_expression.restriction.OWLQuantifiedObjectRestriction` (
filler: owlapy.class_expression.class_expression.OWLClassExpression)

Bases: *OWLQuantifiedRestriction[owlapy.class_expression.class_expression.OWLClassExpression]*, *OWLObjectRestriction*

Represents a quantified object restriction.

`__slots__` = ()

get_filler() \rightarrow *owlapy.class_expression.class_expression.OWLClassExpression*

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns

the value

class `owlapy.class_expression.restriction.OWLObjectCardinalityRestriction` (
cardinality: int, *property: owlapy.owl_property.OWLObjectPropertyExpression*,
filler: owlapy.class_expression.class_expression.OWLClassExpression)

Bases: `OWLCardinalityRestriction[owlapy.class_expression.class_expression.OWLClassExpression]`, `OWLQuantifiedObjectRestriction`

Represents Object Property Cardinality Restrictions in the OWL 2 specification.

`__slots__ = ()`

`get_property()` → `owlapy.owl_property.OWLObjectPropertyExpression`

Returns

Property being restricted.

`__repr__()`

`__eq__(other)`

`__hash__()`

```
class owlapy.class_expression.restriction.OWLObjectMinCardinality (cardinality: int,
    property: owlapy.owl_property.OWLObjectPropertyExpression,
    filler: owlapy.class_expression.class_expression.OWLClassExpression)
```

Bases: `OWLObjectCardinalityRestriction`

A minimum cardinality expression `ObjectMinCardinality(n OPE CE)` consists of a nonnegative integer `n`, an object property expression `OPE`, and a class expression `CE`, and it contains all those individuals that are connected by `OPE` to at least `n` different individuals that are instances of `CE`.     meta_classes.HasOperands[owlapy.owl_individual.OwlIndividual]

    An enumeration of individuals ObjectOneOf( a1 ... an ) contains exactly the individuals ai with  $1 \leq i \leq n$ . (https://www.w3.org/TR/owl2-syntax/#Enumeration\_of\_Individuals)

    __slots__ = '_values'

```

type_index: `Final = 3004`

individuals() → `Iterable[owlapy.owl_individual.OWLIndividual]`
 Gets the individuals that are in the oneOf. These individuals represent the exact instances (extension) of this class expression.

Returns
 The individuals that are the values of this `{@code ObjectOneOf}` class expression.

operands() → `Iterable[owlapy.owl_individual.OWLIndividual]`
 Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

Returns
 The operands.

as_object_union_of() → `owlapy.class_expression.class_expression.OWLClassExpression`
 Simplifies this enumeration to a union of singleton nominals.

Returns
 This enumeration in a more standard DL form. $\text{simp}(\{a\}) = \{a\}$ $\text{simp}(\{a_0, \dots, \{a_n\}) = \text{unionOf}(\{a_0\}, \dots, \{a_n\})$

__eq__(other)

__repr__()

class owlapy.class_expression.restriction.OWLDataRestriction
 Bases: `OWLRestriction`
 Represents a Data Property Restriction.

__slots__ = ()

is_data_restriction() → `bool`
 Determines if this is a data restriction.

Returns
 True if this is a data restriction.

class owlapy.class_expression.restriction.OWLQuantifiedDataRestriction(
 `filler: owlapy.owl_data_ranges.OWLDataRange)`
 Bases: `OWLQuantifiedRestriction[owlapy.owl_data_ranges.OWLDataRange], OWLDataRestriction`
 Represents a quantified data restriction.

__slots__ = ()

get_filler() → `owlapy.owl_data_ranges.OWLDataRange`
 Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns
 the value

```

class owlapy.class_expression.restriction.OWLDataCardinalityRestriction(
    cardinality: int, property: owlapy.owl_property.OWLDataPropertyExpression,
    filler: owlapy.owl_data_ranges.OWLDataRange)

Package Contents

class owlapy.class_expression.OWLClassExpression

Bases: *owlapy.owl_data_ranges.OWLPropertyRange*

OWL Class expressions represent sets of individuals by formally specifying conditions on the individuals' properties; individuals satisfying these conditions are said to be instances of the respective class expressions. In the structural specification of OWL 2, class expressions are represented by *ClassExpression*. (https://www.w3.org/TR/owl2-syntax/#Class_Expressions)

__slots__ = ()

abstract is_owl_thing() → bool

Determines if this expression is the built in class owl:Thing. This method does not determine if the class is equivalent to owl:Thing.

Returns

Thing.

Return type

True if this expression is owl

abstract is_owl_nothing() → bool

Determines if this expression is the built in class owl:Nothing. This method does not determine if the class is equivalent to owl:Nothing.

abstract get_object_complement_of() → *OWLObjectComplementOf*

Gets the object complement of this class expression.

Returns

A class expression that is the complement of this class expression.

abstract get_nnf() → *OWLClassExpression*

Gets the negation normal form of the complement of this expression.

Returns

A expression that represents the NNF of the complement of this expression.

class owlapy.class_expression.OWLAnonymousClassExpression

Bases: *OWLClassExpression*

A Class Expression which is not a named Class.

is_owl_nothing() → bool

Determines if this expression is the built in class owl:Nothing. This method does not determine if the class is equivalent to owl:Nothing.

is_owl_thing() → bool

Determines if this expression is the built in class owl:Thing. This method does not determine if the class is equivalent to owl:Thing.

Returns

Thing.

Return type

True if this expression is owl

get_object_complement_of() → *OWLObjectComplementOf*

Gets the object complement of this class expression.

Returns

A class expression that is the complement of this class expression.

get_nnf() → *OWLClassExpression*

Gets the negation normal form of the complement of this expression.

Returns

A expression that represents the NNF of the complement of this expression.

class owlapy.class_expression.**OWLBooleanClassExpression**

Bases: *OWLAnonymousClassExpression*

Represent an anonymous boolean class expression.

__slots__ = ()

class owlapy.class_expression.**OWLObjectComplementOf** (*op: OWLClassExpression*)

Bases: *OWLBooleanClassExpression*, *owlapy.meta_classes.HasOperands[OWLClassExpression]*

Represents an ObjectComplementOf class expression in the OWL 2 Specification.

__slots__ = '_operand'

type_index: Final = 3003

get_operand() → *OWLClassExpression*

Returns

The wrapped expression.

operands() → *Iterable[OWLClassExpression]*

Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

Returns

The operands.

__repr__()

__eq__ (*other*)

__hash__()

```

class owlapy.class_expression.OWLClass(iri: owlapy.iri.IRI | str)
    Bases: owlapy.class_expression.class_expression.OWLClassExpression, owlapy.
            owl_object.OWLEntity

    An OWL 2 named Class. Classes can be understood as sets of individuals. (https://www.w3.org/TR/owl2-syntax/#Classes)

    __slots__ = ('_iri', '_is_nothing', '_is_thing')

    type_index: Final = 1001

    property iri: owlapy.iri.IRI
        Gets the IRI of this object.

        Returns
            The IRI of this object.

    property str
        Gets the string representation of this object

        Returns
            The IRI as string

    property reminder: str
        The reminder of the IRI

    is_owl_thing() → bool
        Determines if this expression is the built in class owl:Thing. This method does not determine if the class is
        equivalent to owl:Thing.

        Returns
            Thing.

        Return type
            True if this expression is owl

    is_owl_nothing() → bool
        Determines if this expression is the built in class owl:Nothing. This method does not determine if the class
        is equivalent to owl:Nothing.

    get_object_complement_of() → owlapy.class_expression.class_expression.OWLObjectComplementOf
        Gets the object complement of this class expression.

        Returns
            A class expression that is the complement of this class expression.

    get_nnf() → OWLClass
        Gets the negation normal form of the complement of this expression.

        Returns
            A expression that represents the NNF of the complement of this expression.

class owlapy.class_expression.OWLNaryBooleanClassExpression(
    operands: Iterable[owlapy.class_expression.class_expression.OWLClassExpression])
    Bases: owlapy.class_expression.class_expression.OWLBooleanClassExpression,
            owlapy.meta_classes.HasOperands[owlapy.class_expression.class_expression.
            OWLClassExpression]

    OWLNaryBooleanClassExpression.

```

```

__slots__ = ()

operands() → Iterable[owlapy.class_expression.class_expression.OWLClassExpression]
    Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

    Bases: OWLNaryBooleanClassExpression
    An intersection class expression ObjectIntersectionOf( CE1 ... CEn ) contains all individuals that are instances of
    all class expressions CEi for 1 ≤ i ≤ n. (https://www.w3.org/TR/owl2-syntax/#Intersection\_of\_Class\_Expressions)

    __slots__ = '_operands'

    type_index: Final = 3001

class owlapy.class_expression.OWLRestriction
    Bases: owlapy.class_expression.class_expression.OWLAnonymousClassExpression
    Represents an Object Property Restriction or Data Property Restriction in the OWL 2 specification.

    __slots__ = ()

    abstract get_property() → owlapy.owl_property.OWLPropertyExpression

    Returns
        Property being restricted.

    is_data_restriction() → bool
        Determines if this is a data restriction.

    Returns
        True if this is a data restriction.

    is_object_restriction() → bool
        Determines if this is an object restriction.

    Returns
        True if this is an object restriction.

```

```

class owlapy.class_expression.OWLQuantifiedRestriction
    Bases: Generic[_T], OWLRestriction, owlapy.meta_classes.HasFiller[_T]
    Represents a quantified restriction.

    Parameters
        _T – value type

    __slots__ = ()

class owlapy.class_expression.OWLQuantifiedObjectRestriction(
    filler: owlapy.class_expression.class_expression.OWLClassExpression)
    Bases: OWLQuantifiedRestriction[owlapy.class_expression.class_expression.OWLClassExpression], OWLObjectRestriction
    Represents a quantified object restriction.

    __slots__ = ()

    get_filler() → owlapy.class_expression.class_expression.OWLClassExpression
        Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of
        a data restriction this will be a constant (data value). For quantified restriction this will be a class expression
        or a data range.

    Returns
        the value

class owlapy.class_expression.OWLObjectRestriction
    Bases: OWLRestriction
    Represents an Object Property Restriction in the OWL 2 specification.

    __slots__ = ()

    is_object_restriction() → bool
        Determines if this is an object restriction.

    Returns
        True if this is an object restriction.

    abstract get_property() → owlapy.owl_property.OWLObjectPropertyExpression

    Returns
        Property being restricted.

class owlapy.class_expression.OWLHasValueRestriction(value: _T)
    Bases: Generic[_T], OWLRestriction, owlapy.meta_classes.HasFiller[_T]
    Represent a HasValue restriction in the OWL 2

    Parameters
        value – The value type _T.

    __slots__ = ()

    __eq__(other)

    __hash__()

```

get_filler() → *_T*

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns
the value

class owlapy.class_expression.OWLDataRestriction

Bases: *OWLRestriction*

Represents a Data Property Restriction.

__slots__ = ()

is_data_restriction() → bool

Determines if this is a data restriction.

Returns
True if this is a data restriction.

class owlapy.class_expression.OWLCardinalityRestriction(*cardinality: int, filler: _F*)

Bases: *Generic[_F]*, *OWLQuantifiedRestriction[_F]*, *owlapy.meta_classes.HasCardinality*

Base interface for owl min and max cardinality restriction.

Parameters
_F – Type of filler.

__slots__ = ()

get_cardinality() → int

Gets the cardinality of a restriction.

Returns
The cardinality. A non-negative integer.

get_filler() → *_F*

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns
the value

class owlapy.class_expression.OWLObjectCardinalityRestriction(*cardinality: int, property: owlapy.owl_property.OWLObjectPropertyExpression, filler: owlapy.class_expression.class_expression.OWLClassExpression*)

Bases: *OWLCardinalityRestriction[owlapy.class_expression.class_expression.OWLClassExpression]*, *OWLQuantifiedObjectRestriction*

Represents Object Property Cardinality Restrictions in the OWL 2 specification.

__slots__ = ()

get_property() → *owlapy.owl_property.OWLObjectPropertyExpression*

Returns
Property being restricted.

```

__repr__()

owlapy.converter

Format converter.

Attributes

converter

Classes

<code>VariablesMapping</code>	Helper class for owl-to-sparql conversion.
<code>Owl2SparqlConverter</code>	Convert owl (owlapy model class expressions) to SPARQL.

Functions

<code>peek(x)</code>	Peek the last element of an array.
<code>owl_expression_to_sparql(→ str)</code>	Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query
<code>owl_expression_to_sparql_with_confusion_map(→ str)</code>	Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query

Module Contents

`owlapy.converter.peek(x)`

Peek the last element of an array.

Returns

The last element `arr[-1]`.

`class owlapy.converter.VariablesMapping`

Helper class for owl-to-sparql conversion.

`__slots__ = ('class_cnt', 'prop_cnt', 'ind_cnt', 'dict')`

`class_cnt = 0`

`prop_cnt = 0`

`ind_cnt = 0`

`dict`

`get_variable(e: owlapy.owl_object.OWLEntity) → str`

`new_individual_variable() → str`

`new_property_variable() → str`

`__contains__(item: owlapy.owl_object.OWLEntity) → bool`

`__getitem__(item: owlapy.owl_object.OWLEntity) → str`

`class owlapy.converter.Owl2SparqlConverter`

Convert owl (owlapy model class expressions) to SPARQL.

`__slots__ = ('ce', 'sparql', 'variables', 'parent', 'parent_var', 'properties', 'variable_entities', 'cnt', ...)`

`ce: owlapy.class_expression.OWLClassExpression`

```

sparql: List[str]

variables: List[str]

parent: List[owlapy.class_expression.OWLClassExpression]

parent_var: List[str]

variable_entities: Set[owlapy.owl_object.OWLEntity]

properties: Dict[int, List[owlapy.owl_object.OWLEntity]]

mapping: VariablesMapping

grouping_vars: Dict[owlapy.class_expression.OWLClassExpression, Set[str]]

having_conditions: Dict[owlapy.class_expression.OWLClassExpression, Set[str]]

cnt: int

for_all_de_morgan: bool

named_individuals: bool

```

```

convert (root_variable: str, ce: owlapy.class_expression.OWLClassExpression,
        for_all_de_morgan: bool = True, named_individuals: bool = False)

```

Used to convert owl class expression to SPARQL syntax.

Parameters

- **root_variable** (*str*) – Root variable name that will be used in SPARQL query.
- **ce** (*OWLClassExpression*) – The owl class expression to convert.
- **named_individuals** (*bool*) – If ‘True’ return only entities that are instances of owl:NamedIndividual.

Returns

The SPARQL query.

Return type

list[str]

```
property modal_depth
```

```
abstract render(e)
```

```
stack_variable(var)
```

```
stack_parent(parent: owlapy.class_expression.OWLClassExpression)
```

```

named_individuals: bool = False) → str

as_confusion_matrix_query (*root_variable*: str, *ce*: owlapy.class_expression.OWLClassExpression,
positive_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual],
negative_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual],
for_all_de_morgan: bool = True, named_individuals: bool = False) → str

owlapy.converter.converter

owlapy.converter.owl_expression_to_sparql(
expression: owlapy.class_expression.OWLClassExpression = None, root_variable: str = '?x',
values: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None = None,
for_all_de_morgan: bool = True, named_individuals: bool = False) → str

Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query root variable: the variable that will be projected expression: the class expression to be transformed to a SPARQL query

values: positive or negative examples from a class expression problem. Unclear for_all_de_morgan: if set to True, the SPARQL mapping will use the mapping containing the nested FILTER NOT EXISTS patterns for the universal quantifier ($\neg(\exists r. \neg C)$), instead of the counting query named_individuals: if set to True, the generated SPARQL query will return only entities that are instances of owl:NamedIndividual

owlapy.converter.owl_expression_to_sparql_with_confusion_matrix(
expression: owlapy.class_expression.OWLClassExpression,
positive_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None,
negative_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None,
root_variable: str = '?x', for_all_de_morgan: bool = True, named_individuals: bool = False) → str

Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query root variable: the variable that will be projected expression: the class expression to be transformed to a SPARQL query positive_examples: positive examples from a class expression problem negative_examples: positive examples from a class expression problem for_all_de_morgan: if set to True, the SPARQL mapping will use the mapping containing the nested FILTER NOT EXISTS patterns for the universal quantifier ($\neg(\exists r. \neg C)$), instead of the counting query named_individuals: if set to True, the generated SPARQL query will return only entities that are instances of owl:NamedIndividual

owlapy.entities

Entities are the fundamental building blocks of OWL 2 ontologies, and they define the vocabulary — the named terms — of an ontology. In logic, the set of entities is usually said to constitute the signature of an ontology.

Classes, datatypes, object properties, data properties, annotation properties, and named individuals are entities, and they are all uniquely identified by an IR.

owlapy.iri

OWL IRI

Classes

<i>IRI</i>	An IRI, consisting of a namespace and a remainder.
------------	--

Module Contents

class owlapy.iri.IRI(namespace: str | owlapy.namespaces.Namespaces, remainder: str = "")

Bases: owlapy.owl_annotation.OWLAnnotationSubject, owlapy.owl_annotation.OWLAnnotationValue

An IRI, consisting of a namespace and a remainder.

__slots__ = ('_namespace', '_remainder', '__weakref__')

type_index: Final = 0

static create(iri: str | owlapy.namespaces.Namespaces, remainder: str = None) → IRI

__repr__()

__eq__(other)

__hash__()

is_nothing()

Determines if this IRI is equal to the IRI that owl:Nothing is named with.

Returns

True if this IRI is equal to <http://www.w3.org/2002/07/owl#Nothing> and otherwise False.

is_thing()

Determines if this IRI is equal to the IRI that owl:Thing is named with.

Returns

True if this IRI is equal to <http://www.w3.org/2002/07/owl#Thing> and otherwise False.

is_reserved_vocabulary() → bool

Determines if this IRI is in the reserved vocabulary. An IRI is in the reserved vocabulary if it starts with <http://www.w3.org/1999/02/22-rdf-syntax-ns#> or <http://www.w3.org/2000/01/rdf-schema#> or <http://www.w3.org/2001/XMLSchema#> or <http://www.w3.org/2002/07/owl#>.

Returns

True if the IRI is in the reserved vocabulary, otherwise False.

as_iri() → IRI

Returns

if the value is an IRI, return it. Return None otherwise.

as_str() → str

CD: Should be deprecated. :returns: The string that specifies the IRI.

property str: str

Returns: The string that specifies the IRI.

property reminder: str

Returns: The string corresponding to the reminder of the IRI.

`get_namespace()` → str

Returns

The namespace as string.

`get_remainder()` → str

Returns

The remainder (coincident with NCName usually) for this IRI.

owlapy.meta_classes

Meta classes for OWL objects.

Classes

<i>HasIRI</i>	Simple class to access the IRI.
<i>HasOperands</i>	An interface to objects that have a collection of operands.
<i>HasFiller</i>	An interface to objects that have a filler.
<i>HasCardinality</i>	An interface to objects that have a cardinality.

Module Contents

class owlapy.meta_classes.**HasIRI**

Simple class to access the IRI.

__slots__ = ()

abstract property iri

Gets the IRI of this object.

Returns

The IRI of this object.

property str: str

Abstractmethod

Gets the string representation of this object

Returns

The IRI as string

class owlapy.meta_classes.**HasOperands**

Bases: Generic[_T]

An interface to objects that have a collection of operands.

Parameters

_T – Operand type.

__slots__ = ()

abstract operands() → Iterable[_T]

Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

Returns

The operands.

```
class owlapy.meta_classes.HasFiller
```

```
    Bases: Generic[_T]
```

An interface to objects that have a filler.

Parameters

_T – Filler type.

```
    __slots__ = ()
```

```
    abstract get_filler() → _T
```

Gets the filler for this restriction. In the case of an object restriction this will be an individual, in the case of a data restriction this will be a constant (data value). For quantified restriction this will be a class expression or a data range.

Returns

 the value

```
class owlapy.meta_classes.HasCardinality
```

An interface to objects that have a cardinality.

```
    __slots__ = ()
```

```
    abstract get_cardinality() → int
```

Gets the cardinality of a restriction.

Returns

 The cardinality. A non-negative integer.

owlapy.namespaces

Namespaces.

Attributes

OWL

RDFS

RDF

XSD

Classes

Namespaces

Namespaces provide a simple method for qualifying element and attribute names used in Extensible Markup

Module Contents

```
class owlapy.namespaces.Namespaces (prefix: str, ns: str)
```

Namespaces provide a simple method for qualifying element and attribute names used in Extensible Markup Language documents by associating them with namespaces identified by URI references

```

__slots__ = ('_prefix', '_ns')

property ns: str

property prefix: str

__repr__()

__hash__()

__eq__(other)

```

```

owlapy.namespaces.OWL: Final

owlapy.namespaces.RDFS: Final

owlapy.namespaces.RDF: Final

owlapy.namespaces.XSD: Final

```

owlapy.owl_annotation

OWL Annotations

Classes

<i>OWLAnnotationObject</i>	A marker interface for the values (objects) of annotations.
<i>OWLAnnotationSubject</i>	A marker interface for annotation subjects, which can either be IRIs or anonymous individuals
<i>OWLAnnotationValue</i>	A marker interface for annotation values, which can either be an IRI (URI), Literal or Anonymous Individual.

Module Contents

class owlapy.owl_annotation.OWLAnnotationObject

Bases: *owlapy.owl_object.OWLObject*

A marker interface for the values (objects) of annotations.

```
__slots__ = ()
```

```
as_iri()
```

Returns

if the value is an IRI, return it. Return None otherwise.

```
as_anonymous_individual()
```

Returns

if the value is an anonymous, return it. Return None otherwise.

class owlapy.owl_annotation.OWLAnnotationSubject

Bases: *OWLAnnotationObject*

A marker interface for annotation subjects, which can either be IRIs or anonymous individuals

```
__slots__ = ()
```

class owlapy.owl_annotation.OWLAnnotationValue

Bases: *OWLAnnotationObject*

A marker interface for annotation values, which can either be an IRI (URI), Literal or Anonymous Individual.

__slots__ = ()

is_literal() → bool

Returns

true if the annotation value is a literal

as_literal()

Returns

if the value is a literal, returns it. Return None otherwise

owlapy.owl_axiom

OWL Axioms

Classes

<i>OWLAxiom</i>	Represents Axioms in the OWL 2 Specification.
<i>OWLLogicalAxiom</i>	A base interface of all axioms that affect the logical meaning of an ontology. This excludes declaration
<i>OWLPropertyAxiom</i>	The base interface for property axioms.
<i>OWLObjectPropertyAxiom</i>	The base interface for object property axioms.
<i>OWLDatapropertyAxiom</i>	The base interface for data property axioms.
<i>OWLIndividualAxiom</i>	The base interface for individual axioms.
<i>OWLClassAxiom</i>	The base interface for class axioms.
<i>OWLDeclarationAxiom</i>	Represents a Declaration axiom in the OWL 2 Specification. A declaration axiom declares an entity in an ontology.
<i>OWLDatatypeDefinitionAxiom</i>	A datatype definition DatatypeDefinition(DT DR) defines a new datatype DT as being semantically
<i>OWLHasKeyAxiom</i>	A key axiom HasKey(CE (OPE1 ... OPEm) (DPE1 ... DPEn)) states that each
<i>OWLNaryAxiom</i>	Represents an axiom that contains two or more operands that could also be represented with multiple pairwise
<i>OWLNaryClassAxiom</i>	Represents an axiom that contains two or more operands that could also be represented with
<i>OWLEquivalentClassesAxiom</i>	An equivalent classes axiom EquivalentClasses(CE1 ... CEn) states that all of the class expressions CEi,
<i>OWLDisjointClassesAxiom</i>	A disjoint classes axiom DisjointClasses(CE1 ... CEn) states that all of the class expressions CEi, 1 ≤ i ≤ n,
<i>OWLNaryIndividualAxiom</i>	Represents an axiom that contains two or more operands that could also be represented with
<i>OWLDifferentIndividualsAxiom</i>	An individual inequality axiom DifferentIndividuals(a1 ... an) states that all of the individuals ai,
<i>OWLSameIndividualAxiom</i>	An individual equality axiom SameIndividual(a1 ... an) states that all of the individuals ai, 1 ≤ i ≤ n,
<i>OWLNaryPropertyAxiom</i>	Represents an axiom that contains two or more operands that could also be represented with

Table 2 – continued from previous page

<i>OWLEquivalentObjectPropertiesAxiom</i>	An equivalent object properties axiom <i>EquivalentObjectProperties</i> (OPE1 ... OPE _n) states that all of the object
<i>OWLDisjointObjectPropertiesAxiom</i>	A disjoint object properties axiom <i>DisjointObjectProperties</i> (OPE1 ... OPE _n) states that all of the object
<i>OWLInverseObjectPropertiesAxiom</i>	An inverse object properties axiom <i>InverseObjectProperties</i> (OPE1 OPE2) states that the object property
<i>OWLEquivalentDataPropertiesAxiom</i>	An equivalent data properties axiom <i>EquivalentDataProperties</i> (DPE1 ... DPE _n) states that all the data property
<i>OWLDisjointDataPropertiesAxiom</i>	A disjoint data properties axiom <i>DisjointDataProperties</i> (DPE1 ... DPE _n) states that all of the data property
<i>OWLSubClassOfAxiom</i>	A subclass axiom <i>SubClassOf</i> (CE1 CE2) states that the class expression CE1 is a subclass of the class
<i>OWLDisjointUnionAxiom</i>	A disjoint union axiom <i>DisjointUnion</i> (C CE1 ... CE _n) states that a class C is a disjoint union of the class
<i>OWLClassAssertionAxiom</i>	A class assertion <i>ClassAssertion</i> (CE a) states that the individual a is an instance of the class expression CE.
<i>OWLAnnotationProperty</i>	Represents an <i>AnnotationProperty</i> in the OWL 2 specification.
<i>OWLAnnotation</i>	Annotations are used in the various types of annotation axioms, which bind annotations to their subjects
<i>OWLAnnotationAxiom</i>	A super interface for annotation axioms.
<i>OWLAnnotationAssertionAxiom</i>	An annotation assertion <i>AnnotationAssertion</i> (AP as av) states that the annotation subject as — an IRI or an
<i>OWLSubAnnotationPropertyOfAxiom</i>	An annotation subproperty axiom <i>SubAnnotationPropertyOf</i> (AP1 AP2) states that the annotation property AP1 is
<i>OWLAnnotationPropertyDomainAxiom</i>	An annotation property domain axiom <i>AnnotationPropertyDomain</i> (AP U) states that the domain of the annotation
<i>OWLAnnotationPropertyRangeAxiom</i>	An annotation property range axiom <i>AnnotationPropertyRange</i> (AP U)
<i>OWLSubPropertyAxiom</i>	Base interface for object and data sub-property axioms.
<i>OWLSubObjectPropertyOfAxiom</i>	Object subproperty axioms are analogous to subclass axioms, and they come in two forms.
<i>OWLSubDataPropertyOfAxiom</i>	A data subproperty axiom <i>SubDataPropertyOf</i> (DPE1 DPE2) states that the data property expression DPE1 is a
<i>OWLPropertyAssertionAxiom</i>	Base class for Property Assertion axioms.
<i>OWLObjectPropertyAssertionAxiom</i>	A positive object property assertion <i>ObjectPropertyAssertion</i> (OPE a1 a2) states that the individual a1 is
<i>OWLNegativeObjectPropertyAssertionAxiom</i>	A negative object property assertion <i>NegativeObjectPropertyAssertion</i> (OPE a1 a2) states that the individual a1
<i>OWLDataPropertyAssertionAxiom</i>	A positive data property assertion <i>DataPropertyAssertion</i> (DPE a lt) states that the individual a is connected
<i>OWLNegativeDataPropertyAssertionAxiom</i>	A negative data property assertion <i>NegativeDataPropertyAssertion</i> (DPE a lt) states that the individual a is not
<i>OWLUnaryPropertyAxiom</i>	Base class for Unary property axiom.
<i>OWLObjectPropertyCharacteristicAxiom</i>	Base interface for functional object property axiom.

Table 2 – continued from previous page

<i>OWLFunctionalObjectPropertyAxiom</i>	An object property functionality axiom <code>FunctionalObjectProperty(OPE)</code> states that
<i>OWLASymmetricObjectPropertyAxiom</i>	An object property asymmetry axiom <code>AsymmetricObjectProperty(OPE)</code> states that
<i>OWLInverseFunctionalObjectPropertyAxiom</i>	An object property inverse functionality axiom <code>InverseFunctionalObjectProperty(OPE)</code>
<i>OWLIrreflexiveObjectPropertyAxiom</i>	An object property irreflexivity axiom <code>IrreflexiveObjectProperty(OPE)</code> states that the
<i>OWLReflexiveObjectPropertyAxiom</i>	An object property reflexivity axiom <code>ReflexiveObjectProperty(OPE)</code> states that the
<i>OWLSymmetricObjectPropertyAxiom</i>	An object property symmetry axiom <code>SymmetricObjectProperty(OPE)</code> states that
<i>OWLTransitiveObjectPropertyAxiom</i>	An object property transitivity axiom <code>TransitiveObjectProperty(OPE)</code> states that the
<i>OWLDataPropertyCharacteristicAxiom</i>	Base interface for Functional data property axiom.
<i>OWLFunctionalDataPropertyAxiom</i>	A data property functionality axiom <code>FunctionalDataProperty(DPE)</code> states that
<i>OWLPropertyDomainAxiom</i>	Base class for Property Domain axioms.
<i>OWLPropertyRangeAxiom</i>	Base class for Property Range axioms.
<i>OWLObjectPropertyDomainAxiom</i>	An object property domain axiom <code>ObjectPropertyDomain(OPE CE)</code> states that the domain of the
<i>OWLDataPropertyDomainAxiom</i>	A data property domain axiom <code>DataPropertyDomain(DPE CE)</code> states that the domain of the
<i>OWLObjectPropertyRangeAxiom</i>	An object property range axiom <code>ObjectPropertyRange(OPE CE)</code> states that the range of the object property
<i>OWLDataPropertyRangeAxiom</i>	A data property range axiom <code>DataPropertyRange(DPE DR)</code> states that the range of the data property

Module Contents

class owlapy.owl_axiom.**OWLAxiom** (*annotations: Iterable[OWLAnnotation] | None = None*)

Bases: owlapy.owl_object.OWLObject

Represents Axioms in the OWL 2 Specification.

An OWL ontology contains a set of axioms. These axioms can be annotation axioms, declaration axioms, imports axioms or logical axioms.

__slots__ = '_annotations'

annotations () → List[OWLAnnotation] | None

is_annotated () → bool

is_logical_axiom () → bool

is_annotation_axiom () → bool

class owlapy.owl_axiom.**OWLLogicalAxiom** (*annotations: Iterable[OWLAnnotation] | None = None*)

Bases: OWLAxiom

A base interface of all axioms that affect the logical meaning of an ontology. This excludes declaration axioms (including imports declarations) and annotation axioms.

__slots__ = ()

```

    is_logical_axiom() → bool

class owlapy.owl_axiom.OWLPropertyAxiom(annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLLogicalAxiom
    The base interface for property axioms.
    __slots__ = ()

class owlapy.owl_axiom.OWLObjectPropertyAxiom(
    annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLPropertyAxiom
    The base interface for object property axioms.
    __slots__ = ()

class owlapy.owl_axiom.OWLDataPropertyAxiom(
    annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLPropertyAxiom
    The base interface for data property axioms.
    __slots__ = ()

class owlapy.owl_axiom.OWLIndividualAxiom(annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLLogicalAxiom
    The base interface for individual axioms.
    __slots__ = ()

class owlapy.owl_axiom.OWLClassAxiom(annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLLogicalAxiom
    The base interface for class axioms.
    __slots__ = ()

class owlapy.owl_axiom.OWLDeclarationAxiom(entity: owlapy.owl_object.OWLEntity,
    annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLAxiom
    Represents a Declaration axiom in the OWL 2 Specification. A declaration axiom declares an entity in an ontology.
    It doesn't affect the logical meaning of the ontology.
    __slots__ = '_entity'
    get_entity() → owlapy.owl_object.OWLEntity
    __eq__(other)
    __hash__()
    __repr__()

class owlapy.owl_axiom.OWLDatatypeDefinitionAxiom(
    datatype: owlapy.owl_datatype.OWLDatatype, datarange: owlapy.owl_datatype.OWLDataRange,
    annotations: Iterable[OWLAnnotation] | None = None)

```

Bases: *OWLLogicalAxiom*

A datatype definition `DatatypeDefinition(DT DR)` defines a new datatype `DT` as being semantically equivalent to the data range `DR`; the latter must be a unary data range. This axiom allows one to use the defined datatype `DT` as a synonym for `DR` — that is, in any expression in the ontology containing such an axiom, `DT` can be replaced with `DR` without affecting the meaning of the ontology.

(https://www.w3.org/TR/owl2-syntax/#Datatype_Definitions)

```
__slots__ = ('_datatype', '_datarange')

get_datatype() → owlapy.owl_datatype.OWLDataType

get_datarange() → owlapy.owl_datatype.OWLDataRange

__eq__(other)

__hash__()

__repr__()
```

```
class owlapy.owl_axiom.OWLHasKeyAxiom(
    class_expression: owlapy.class_expression.OWLClassExpression,
    property_expressions: List[owlapy.owl_property.OWLPropertyExpression],
    annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: *OWLLogicalAxiom*, *owlapy.meta_classes.HasOperands[owlapy.owl_property.OWLPropertyExpression]*

A key axiom `HasKey(CE (OPE1 ... OPEm) (DPE1 ... DPEn))` states that each (named) instance of the class expression `CE` is uniquely identified by the object property expressions `OPEi` and/or the data property expressions `DPEj` — that is, no two distinct (named) instances of `CE` can coincide on the values of all object property expressions `OPEi` and all data property expressions `DPEj`. In each such axiom in an OWL ontology, `m` or `n` (or both) must be larger than zero. A key axiom of the form `HasKey(owl:Thing (OPE))` is similar to the axiom `InverseFunctionalObjectProperty(OPE)`, the main differences being that the former axiom is applicable only to individuals that are explicitly named in an ontology, while the latter axiom is also applicable to anonymous individuals and individuals whose existence is implied by existential quantification.

(<https://www.w3.org/TR/owl2-syntax/#Keys>)

```
__slots__ = ('_class_expression', '_property_expressions')

get_class_expression() → owlapy.class_expression.OWLClassExpression

get_property_expressions() → List[owlapy.owl_property.OWLPropertyExpression]

operands() → Iterable[owlapy.owl_property.OWLPropertyExpression]
```

Gets the operands - e.g., the individuals in a `sameAs` axiom, or the classes in an `equivalentClasses` axiom.

Returns

The operands.

```
__eq__(other)

__hash__()

__repr__()
```

```
class owlapy.owl_axiom.OWLNaryAxiom (annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: Generic[_C], OWLAxiom

Represents an axiom that contains two or more operands that could also be represented with multiple pairwise axioms.

Parameters

_C – Class of contained objects.

```
__slots__ = ()
```

```
abstract as_pairwise_axioms () → Iterable[OWLNaryAxiom[_C]]
```

```
class owlapy.owl_axiom.OWLNaryClassAxiom (
    class_expressions: List[owlapy.class_expression.OWLClassExpression],
    annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: OWLClassAxiom, OWLNaryAxiom[owlapy.class_expression.OWLClassExpression]

Represents an axiom that contains two or more operands that could also be represented with multiple pairwise axioms.

```
__slots__ = '_class_expressions'
```

```
class_expressions () → Iterable[owlapy.class_expression.OWLClassExpression]
```

Gets all of the top level class expressions that appear in this axiom.

Returns

Sorted stream of class expressions that appear in the axiom.

```
as_pairwise_axioms () → Iterable[OWLNaryClassAxiom]
```

Gets this axiom as a set of pairwise axioms; if the axiom contains only two operands, the axiom itself is returned unchanged, including its annotations.

Returns

This axiom as a set of pairwise axioms.

```
__eq__ (other)
```

```
__hash__ ()
```

```
__repr__ ()
```

```
class owlapy.owl_axiom.OWLEquivalentClassesAxiom (
    class_expressions: List[owlapy.class_expression.OWLClassExpression],
    annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: OWLNaryClassAxiom

An equivalent classes axiom EquivalentClasses(CE₁ ... CE_n) states that all of the class expressions CE_i, 1 ≤ i ≤ n, are semantically equivalent to each other. This axiom allows one to use each CE_i as a synonym for each CE_j — that is, in any expression in the ontology containing such an axiom, CE_i can be replaced with CE_j without affecting the meaning of the ontology.

(https://www.w3.org/TR/owl2-syntax/#Equivalent_Classes)

```
__slots__ = ()
```

```
__iter__ ()
```

```
contains_named_equivalent_class () → bool
```

```

contains_owl_nothing() → bool

contains_owl_thing() → bool

named_classes() → Iterable[owlapy.class_expression.OWLClass]

```

class owlapy.owl_axiom.OWLDisjointClassesAxiom(
 class_expressions: List[owlapy.class_expression.OWLClassExpression],
 annotations: Iterable[OWLAnnotation] | None = None)
Bases: OWLNaryClassAxiom

A disjoint classes axiom DisjointClasses(CE1 ... CEn) states that all of the class expressions CE_i, 1 ≤ i ≤ n, are pairwise disjoint; that is, no individual can be at the same time an instance of both CE_i and CE_j for i ≠ j.

(https://www.w3.org/TR/owl2-syntax/#Disjoint_Classes)

```

__slots__ = ()

```

class owlapy.owl_axiom.OWLNaryIndividualAxiom(
 individuals: List[owlapy.owl_individual.OWLIndividual],
 annotations: Iterable[OWLAnnotation] | None = None)
Bases: OWLIndividualAxiom, OWLNaryAxiom[owlapy.owl_individual.OWLIndividual]

Represents an axiom that contains two or more operands that could also be represented with multiple pairwise individual axioms.

```

__slots__ = '_individuals'

```

individuals() → Iterable[owlapy.owl_individual.OWLIndividual]
 Get the individuals.

Returns
 Generator containing the individuals.

as_pairwise_axioms() → Iterable[OWLNaryIndividualAxiom]

```

__eq__(other)

__hash__()

__repr__()

```

class owlapy.owl_axiom.OWLDifferentIndividualsAxiom(
 individuals: List[owlapy.owl_individual.OWLIndividual],
 annotations: Iterable[OWLAnnotation] | None = None)
Bases: OWLNaryIndividualAxiom

An individual inequality axiom DifferentIndividuals(a1 ... an) states that all of the individuals a_i, 1 ≤ i ≤ n, are different from each other; that is, no individuals a_i and a_j with i ≠ j can be derived to be equal. This axiom can be used to axiomatize the unique name assumption — the assumption that all different individual names denote different individuals. (https://www.w3.org/TR/owl2-syntax/#Individual_Inequality)

```

__slots__ = ()

```

class owlapy.owl_axiom.OWLSameIndividualAxiom(
 individuals: List[owlapy.owl_individual.OWLIndividual],
 annotations: Iterable[OWLAnnotation] | None = None)
Bases: OWLNaryIndividualAxiom

An individual equality axiom `SameIndividual(a1 ... an)` states that all of the individuals a_i , $1 \leq i \leq n$, are equal to each other. This axiom allows one to use each a_i as a synonym for each a_j — that is, in any expression in the ontology containing such an axiom, a_i can be replaced with a_j without affecting the meaning of the ontology.

(https://www.w3.org/TR/owl2-syntax/#Individual_Equality)

```
__slots__ = ()
```

```
class owlapy.owl_axiom.OWLNaryPropertyAxiom(properties: List[_P],
      annotations: Iterable[OWLAnnotation] | None = None)
```

```
Bases: Generic[_P], OWLPropertyAxiom, OWLNaryAxiom[_P]
```

Represents an axiom that contains two or more operands that could also be represented with multiple pairwise property axioms.

```
__slots__ = '_properties'
```

```
properties() → Iterable[_P]
```

Get all the properties that appear in the axiom.

Returns

Generator containing the properties.

```
as_pairwise_axioms() → Iterable[OWLNaryPropertyAxiom]
```

```
__eq__(other)
```

```
__hash__()
```

```
__repr__()
```

```
class owlapy.owl_axiom.OWLEquivalentObjectPropertiesAxiom(
      properties: List[owlapy.owl_property.OWLObjectPropertyExpression],
      annotations: Iterable[OWLAnnotation] | None = None)
```

```
Bases: OWLNaryPropertyAxiom[owlapy.owl_property.OWLObjectPropertyExpression], OWLObjectPropertyAxiom
```

An equivalent object properties axiom `EquivalentObjectProperties(OPE1 ... OPEn)` states that all of the object property expressions OPE_i , $1 \leq i \leq n$, are semantically equivalent to each other. This axiom allows one to use each OPE_i as a synonym for each OPE_j — that is, in any expression in the ontology containing such an axiom, OPE_i can be replaced with OPE_j without affecting the meaning of the ontology.

(https://www.w3.org/TR/owl2-syntax/#Equivalent_Object_Properties)

```
__slots__ = ()
```

```
class owlapy.owl_axiom.OWLDisjointObjectPropertiesAxiom(
      properties: List[owlapy.owl_property.OWLObjectPropertyExpression],
      annotations: Iterable[OWLAnnotation] | None = None)
```

```
Bases: OWLNaryPropertyAxiom[owlapy.owl_property.OWLObjectPropertyExpression], OWLObjectPropertyAxiom
```

A disjoint object properties axiom `DisjointObjectProperties(OPE1 ... OPEn)` states that all of the object property expressions OPE_i , $1 \leq i \leq n$, are pairwise disjoint; that is, no individual x can be connected to an individual y by both OPE_i and OPE_j for $i \neq j$.

(https://www.w3.org/TR/owl2-syntax/#Disjoint_Object_Properties)

```
__slots__ = ()
```

```
class owlapy.owl_axiom.OwlInverseObjectPropertiesAxiom(
    first: owlapy.owl_property.OwlObjectPropertyExpression,
    second: owlapy.owl_property.OwlObjectPropertyExpression,
    annotations: Iterable[OwlAnnotation] | None = None)

Bases: OwlNaryPropertyAxiom[owlapy.owl_property.OwlObjectPropertyExpression], OwlObjectPropertyAxiom
```

An inverse object properties axiom InverseObjectProperties(OPE1 OPE2) states that the object property expression OPE1 is an inverse of the object property expression OPE2. Thus, if an individual x is connected by OPE1 to an individual y, then y is also connected by OPE2 to x, and vice versa.

(https://www.w3.org/TR/owl2-syntax/#Inverse_Object_Properties_2)

```
__slots__ = ('_first', '_second')

get_first_property() → owlapy.owl_property.OwlObjectPropertyExpression

get_second_property() → owlapy.owl_property.OwlObjectPropertyExpression

__repr__()
```

```
class owlapy.owl_axiom.OwlEquivalentDataPropertiesAxiom(
    properties: List[owlapy.owl_property.OwlDataPropertyExpression],
    annotations: Iterable[OwlAnnotation] | None = None)

Bases: OwlNaryPropertyAxiom[owlapy.owl_property.OwlDataPropertyExpression], OwlDataPropertyAxiom
```

An equivalent data properties axiom EquivalentDataProperties(DPE1 ... DPE_n) states that all the data property expressions DPE_i, 1 ≤ i ≤ n, are semantically equivalent to each other. This axiom allows one to use each DPE_i as a synonym for each DPE_j — that is, in any expression in the ontology containing such an axiom, DPE_i can be replaced with DPE_j without affecting the meaning of the ontology.

(https://www.w3.org/TR/owl2-syntax/#Equivalent_Data_Properties)

```
__slots__ = ()
```

```
class owlapy.owl_axiom.OwlDisjointDataPropertiesAxiom(
    properties: List[owlapy.owl_property.OwlDataPropertyExpression],
    annotations: Iterable[OwlAnnotation] | None = None)

Bases: OwlNaryPropertyAxiom[owlapy.owl_property.OwlDataPropertyExpression], OwlDataPropertyAxiom
```

A disjoint data properties axiom DisjointDataProperties(DPE1 ... DPE_n) states that all of the data property expressions DPE_i, 1 ≤ i ≤ n, are pairwise disjoint; that is, no individual x can be connected to a literal y by both

DPE_i and DPE_j for i ≠ j.

(https://www.w3.org/TR/owl2-syntax/#Disjoint_Data_Properties)

```
__slots__ = ()
```

```
class owlapy.owl_axiom.OwlSubClassOfAxiom(
    sub_class: owlapy.class_expression.OwlClassExpression,
    super_class: owlapy.class_expression.OwlClassExpression,
    annotations: Iterable[OwlAnnotation] | None = None)

Bases: OwlClassAxiom
```

A subclass axiom SubClassOf(CE1 CE2) states that the class expression CE1 is a subclass of the class expression CE2. Roughly speaking, this states that CE1 is more specific than CE2. Subclass axioms are a fundamental type of axioms in OWL 2 and can be used to construct a class hierarchy. Other kinds of class expression axiom can be seen as syntactic shortcuts for one or more subclass axioms.

(https://www.w3.org/TR/owl2-syntax/#Subclass_Axioms)

```
__slots__ = ('_sub_class', '_super_class')

property sub_class: owlapy.class_expression.OWLClassExpression

property super_class: owlapy.class_expression.OWLClassExpression

get_sub_class() → owlapy.class_expression.OWLClassExpression

get_super_class() → owlapy.class_expression.OWLClassExpression

__eq__(other)

__hash__()

__repr__()
```

```
class owlapy.owl_axiom.OWLDisjointUnionAxiom(cls_: owlapy.class_expression.OWLClass,
        class_expressions: List[owlapy.class_expression.OWLClassExpression],
        annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: *OWLClassAxiom*

A disjoint union axiom `DisjointUnion(C CE1 ... CEn)` states that a class `C` is a disjoint union of the class expressions `CEi`, $1 \leq i \leq n$, all of which are pairwise disjoint. Such axioms are sometimes referred to as covering axioms, as they state that the extensions of all `CEi` exactly cover the extension of `C`. Thus, each instance of `C` is an instance of exactly one `CEi`, and each instance of `CEi` is an instance of `C`.

(https://www.w3.org/TR/owl2-syntax/#Disjoint_Union_of_Class_Expressions)

```
__slots__ = ('_cls', '_class_expressions')

get_owl_class() → owlapy.class_expression.OWLClass

get_class_expressions() → Iterable[owlapy.class_expression.OWLClassExpression]

__repr__()

class owlapy.owl_axiom.OWLAnnotationProperty(iri: owlapy.iri.IRI | str)
    Bases: owlapy.owl_property.OWLProperty
    Represents an AnnotationProperty in the OWL 2 specification.

    __slots__ = '_iri'

    property iri: owlapy.iri.IRI
        Gets the IRI of this object.

        Returns
            The IRI of this object.

    property str: str
        Gets the string representation of this object

        Returns
            The IRI as string

class owlapy.owl_axiom.OWLAnnotation(property: OWLAnnotationProperty,
    value: owlapy.owl_annotation.OWLAnnotationValue)
    Bases: owlapy.owl_object.OWLObject
    Annotations are used in the various types of annotation axioms, which bind annotations to their subjects (i.e. axioms
    or declarations).

    __slots__ = ('_property', '_value')

    get_property() → OWLAnnotationProperty
        Gets the property that this annotation acts along.

        Returns
            The annotation property.

    get_value() → owlapy.owl_annotation.OWLAnnotationValue
        Gets the annotation value. The type of value will depend upon the type of the annotation e.g. whether the
        annotation is an OWLLiteral, an IRI or an OWLAnonymousIndividual.

        Returns
            The annotation value.

    __eq__(other)

    __hash__()

    __repr__()

class owlapy.owl_axiom.OWLAnnotationAxiom(annotations: Iterable[OWLAnnotation] | None = None)
    Bases: OWLAxiom
    A super interface for annotation axioms.

    __slots__ = ()

    is_annotation_axiom() → bool

```

```
class owlapy.owl_axiom.OWLAnnotationAssertionAxiom(
    subject: owlapy.owl_annotation.OWLAnnotationSubject, annotation: OWLAnnotation,
    annotations: Iterable[OWLAnnotation] | None = None)
```

Bases: *OWLAnnotationAxiom*

An annotation assertion `AnnotationAssertion(AP as av)` states that the annotation subject as — an IRI or an anonymous individual — is annotated with the annotation property AP and the annotation value av.

(https://www.w3.org/TR/owl2-syntax/#Annotation_Assertion)

```
__slots__ = ('_subject', '_annotation')
```

```
get_subject() → owlapy.owl_annotation.OWLAnnotationSubject
```

Gets the subject of this object.

Returns

The subject.

```
get_property() → OWLAnnotationProperty
```

Gets the property.

Returns

The property.

```
get_value() → owlapy.owl_annotation.OWLAnnotationValue
```

Gets the annotation value. This is either an IRI, an `OWLAnonymousIndividual` or an `OWLLiteral`.

Returns

The annotation value.

    annotations: Iterable[OWLAnnotation] | None = None)

Bases: OWLSubPropertyAxiom[owlapy.owl_property.OWLObjectPropertyExpression], OWLObjectPropertyAxiom
```

Object subproperty axioms are analogous to subclass axioms, and they come in two forms. The basic form is SubObjectPropertyOf(OPE1 OPE2). This axiom states that the object property expression OPE1 is a subproperty of the object property expression OPE2 — that is, if an individual x is connected by OPE1 to an individual y, then x is also connected by OPE2 to y. The more complex form is SubObjectPropertyOf(ObjectPropertyChain(OPE1 ... OPE_n) OPE) but ObjectPropertyChain is not represented in owlapy yet.

OWL Data Ranges

https://www.w3.org/TR/owl2-syntax/#Data_Ranges

DataRange := Datatype | DataIntersectionOf | DataUnionOf | DataComplementOf | DataOneOf | DatatypeRestriction

Classes

<i>OWLPropertyRange</i>	OWL Objects that can be the ranges of properties.
<i>OWLDataRange</i>	Represents a DataRange in the OWL 2 Specification.
<i>OWLNaryDataRange</i>	OWLNaryDataRange.
<i>OWLDataIntersectionOf</i>	An intersection data range DataIntersectionOf(DR1 ... DRn) contains all tuples of literals that are contained
<i>OWLDataUnionOf</i>	A union data range DataUnionOf(DR1 ... DRn) contains all tuples of literals that are contained in the at least
<i>OWLDataComplementOf</i>	A complement data range DataComplementOf(DR) contains all tuples of literals that are not contained in the

Module Contents

```
class owlapy.owl_data_ranges.OWLPropertyRange
```

Bases: *owlapy.owl_object.OWLObject*

OWL Objects that can be the ranges of properties.

```
class owlapy.owl_data_ranges.OWLDataRange
```

Bases: *OWLPropertyRange*

Represents a DataRange in the OWL 2 Specification.

```
class owlapy.owl_data_ranges.OWLNaryDataRange(operands: Iterable[OWLDataRange])
```

Bases: *OWLDataRange*, *owlapy.meta_classes.HasOperands[OWLDataRange]*

OWLNaryDataRange.

```
__slots__ = ()
```

```
operands() → Iterable[OWLDataRange]
```

Gets the operands - e.g., the individuals in a sameAs axiom, or the classes in an equivalent classes axiom.

Returns

The operands.

```
__repr__()
```

```
__eq__(other)
```

```
__hash__()
```

```
class owlapy.owl_data_ranges.OWLDataIntersectionOf (operands: Iterable[OWLDataRange])
```

Bases: *OWLNaryDataRange*

An intersection data range *DataIntersectionOf*(DR1 ... DRn) contains all tuples of literals that are contained in each data range DRi for $1 \leq i \leq n$. All data ranges DRi must be of the same arity, and the resulting data range is of that arity as well.

(https://www.w3.org/TR/owl2-syntax/#Intersection_of_Data_Ranges)

owlapy.owl_datatype

OWL Datatype

Classes

OWLDatatype

Datatypes are entities that refer to sets of data values. Thus, datatypes are analogous to classes,

Module Contents

class owlapy.owl_datatype.**OWLDatatype** (*iri: owlapy.iri.IRI | owlapy.meta_classes.HasIRI*)

Bases: *owlapy.owl_object.OWLEntity, owlapy.owl_data_ranges.OWLDataRange*

Datatypes are entities that refer to sets of data values. Thus, datatypes are analogous to classes, the main difference being that the former contain data values such as strings and numbers, rather than individuals. Datatypes are a kind of data range, which allows them to be used in restrictions. Each data range is associated with an arity; for datatypes, the arity is always one. The built-in datatype `rdfs:Literal` denotes any set of data values that contains the union of the value spaces of all datatypes.

(<https://www.w3.org/TR/owl2-syntax/#Datatypes>)

__slots__ = `'_iri'`

type_index: `Final = 4001`

property iri: *owlapy.iri.IRI*

Gets the IRI of this object.

Returns

The IRI of this object.

property str: `str`

Gets the string representation of this object

Returns

The IRI as string

owlapy.owl_hierarchy

Classes representing hierarchy in OWL.

Classes

<i>AbstractHierarchy</i>	Representation of an abstract hierarchy which can be used for classes or properties.
<i>ClassHierarchy</i>	Representation of a class hierarchy.
<i>ObjectPropertyHierarchy</i>	Representation of an object property hierarchy.
<i>DatatypePropertyHierarchy</i>	Representation of a data property hierarchy.

Module Contents

class owlapy.owl_hierarchy.**AbstractHierarchy** (*factory: Type[_S],
hierarchy_down: Iterable[Tuple[_S, Iterable[_S]]]*)

class owlapy.owl_hierarchy.**AbstractHierarchy** (*factory: Type[_S],
reasoner: owlapy.abstracts.abstract_owl_reasoner.AbstractOWLReasoner*)

Bases: `Generic[_S]`

Representation of an abstract hierarchy which can be used for classes or properties.

Parameters

- **hierarchy_down** – A downwards hierarchy given as a mapping of Entities to sub-entities.
- **reasoner** – Alternatively, a reasoner whose `root_ontology` is queried for entities.

```
__slots__ = ('_Type', '_ent_set', '_parents_map', '_parents_map_trans',
'_children_map', ...)
```

```
classmethod get_top_entity() → _S
```

Abstractmethod

The most general entity in this hierarchy, which contains all the entities.

```
classmethod get_bottom_entity() → _S
```

Abstractmethod

The most specific entity in this hierarchy, which contains none of the entities.

```
static restrict (hierarchy: _U, *, remove: Iterable[_S] = None, allow: Iterable[_S] = None) → _U
```

Restrict a given hierarchy to a set of allowed/removed entities.

Parameters

- **hierarchy** – An existing Entity hierarchy to restrict.
- **remove** – Set of entities which should be ignored.
- **allow** – Set of entities which should be used.

Returns

The restricted hierarchy.

```
restrict_and_copy (*, remove: Iterable[_S] = None, allow: Iterable[_S] = None) → _U
```

Restrict this hierarchy.

See restrict for more info.

```
parents (entity: _S, direct: bool = True) → Iterable[_S]
```

Parents of an entity.

Parameters

- **entity** – Entity for which to query parent entities.
- **direct** – False to return transitive parents.

Returns

Super-entities.

```
is_parent_of (a: _S, b: _S) → bool
```

if A is a parent of B.

Note

A is always a parent of A.

```
is_child_of (a: _S, b: _S) → bool
```

If A is a child of B.

Note

A is always a child of A.

children (*entity*: *_S*, *direct*: *bool* = *True*) → *Iterable[_S]*

Children of an entity.

Parameters

- **entity** – Entity for which to query child entities.
- **direct** – False to return transitive children.

Returns

Sub-entities.

siblings (*entity*: *_S*) → *Iterable[_S]*

items () → *Iterable[_S]*

roots (*of*: *_S* | *None* = *None*) → *Iterable[_S]*

leaves (*of*: *_S* | *None* = *None*) → *Iterable[_S]*

__contains__ (*item*: *_S*) → *bool*

__len__ ()

```

```

```
class owlapy.owl_hierarchy.ClassHierarchy(  
    reasoner: owlapy.abstracts.abstract_owl_reasoner.AbstractOWLReasoner)
```

Bases: *AbstractHierarchy*[*owlapy.class_expression.OWLClass*]

Representation of a class hierarchy.

Parameters

- **hierarchy_down** – A downwards hierarchy given as a mapping of Class to sub-classes.
- **reasoner** – Alternatively, a reasoner whose *root_ontology* is queried for classes and sub-classes.

classmethod get_top_entity () → *owlapy.class_expression.OWLClass*

The most general entity in this hierarchy, which contains all the entities.

classmethod get_bottom_entity () → *owlapy.class_expression.OWLClass*

The most specific entity in this hierarchy, which contains none of the entities.

sub_classes (*entity*: *owlapy.class_expression.OWLClass*, *direct*: *bool* = *True*)

class owlapy.owl_hierarchy.DatatypePropertyHierarchy (
    reasoner: owlapy.abstracts.abstract_owl_reasoner.AbstractOWLReasoner)
Bases: AbstractHierarchy[owlapy.owl_property.OWLDataProperty]
Representation of a data property hierarchy.

classmethod get_top_entity () → owlapy.owl_property.OWLDataProperty
    The most general entity in this hierarchy, which contains all the entities.

classmethod get_bottom_entity () → owlapy.owl_property.OWLDataProperty
    The most specific entity in this hierarchy, which contains none of the entities.

sub_data_properties (entity: owlapy.owl_property.OWLDataProperty, direct: bool = True)

super_data_properties (entity: owlapy.owl_property.OWLDataProperty, direct: bool = True)

more_general_roles (role: owlapy.owl_property.OWLDataProperty, direct: bool = True)
    → Iterable[owlapy.owl_property.OWLDataProperty]

more_special_roles (role: owlapy.owl_property.OWLDataProperty, direct: bool = True)
    → Iterable[owlapy.owl_property.OWLDataProperty]

is_sub_property_of (sub_property: owlapy.owl_property.OWLDataProperty,
    super_property: owlapy.owl_property.OWLDataProperty) → bool

```

`most_general_roles()` → Iterable[*owlapy.owl_property.OWLDataProperty*]

`most_special_roles()` → Iterable[*owlapy.owl_property.OWLDataProperty*]

owlapy.owl_individual

OWL Individuals

Classes

<i>OWLIndividual</i>	Represents a named or anonymous individual.
<i>OWLNamedIndividual</i>	Named individuals are identified using an IRI. Since they are given an IRI, named individuals are entities.

Module Contents

class owlapy.owl_individual.OWLIndividual

Bases: *owlapy.owl_object.OWLObject*

Represents a named or anonymous individual.

`__slots__ = ()`

class owlapy.owl_individual.OWLNamedIndividual (*iri: owlapy.iri.IRI | str*)

Bases: *OWLIndividual*, *owlapy.owl_object.OWLEntity*

Named individuals are identified using an IRI. Since they are given an IRI, named individuals are entities. IRIs from the reserved vocabulary must not be used to identify named individuals in an OWL 2 DL ontology.

(https://www.w3.org/TR/owl2-syntax/#Named_Individuals)

`__slots__ = '_iri'`

`type_index: Final = 1005`

property *iri: owlapy.iri.IRI*

Gets the IRI of this object.

Returns

The IRI of this object.

property *str*

Gets the string representation of this object

Returns

The IRI as string

property *reminder*

owlapy.owl_literal

OWL Literals

Attributes

<i>OWLTopObjectProperty</i>

```

```
owlapy.owl_literal.TIME_DATATYPES: Final[Set[owlapy.owl_datatype.OWLDatatype]]
```

```
class owlapy.owl_literal.FloatSpecialValue
```

Bases: `enum.Enum`

Generic enumeration.

Derive from this class to define new enumerations.

```
NAN = 'Nan'
```

```
POS_INF = 'INF'
```

```
NEG_INF = '-INF'
```

```
__str__()
```

```
owlapy.owl_literal.Literals
```

```
class owlapy.owl_literal.OWLLiteral
```

Bases: `owlapy.owl_annotation.OWLAnnotationValue`

Literals represent data values such as particular strings or integers. They are analogous to typed RDF literals and can also be understood as individuals denoting data values. Each literal consists of a lexical form, which is a string, and a datatype.

(<https://www.w3.org/TR/owl2-syntax/#Literals>)

```
__slots__ = ()
```

```
type_index: Final = 4008
```

```
get_literal() → str
```

Gets the lexical value of this literal. Note that the language tag is not included.

Returns

The lexical value of this literal.

```
is_boolean() → bool
```

Whether this literal is typed as boolean.

```
parse_boolean() → bool
```

Parses the lexical value of this literal into a bool. The lexical value of this literal should be in the lexical space of the boolean datatype ("<http://www.w3.org/2001/XMLSchema#boolean>").

Returns

A bool value that is represented by this literal.

```
is_double() → bool
```

Whether this literal is typed as double.

```
parse_double() → float
```

Parses the lexical value of this literal into a double. The lexical value of this literal should be in the lexical space of the double datatype ("https://www.w3.org/TR/owl2-syntax/#Floating-Point_Numbers").

Returns

A double value that is represented by this literal.

```
is_float() → bool
```

Whether this literal is typed as float.

parse_float() → float

Parses the lexical value of this literal into a float. The lexical value of this literal should be in the lexical space of the float datatype ("https://www.w3.org/TR/owl2-syntax/#Floating-Point_Numbers").

Returns

A float value that is represented by this literal.

is_decimal() → bool

Whether this literal is typed as decimal.

parse_decimal() → decimal.Decimal

Parses the lexical value of this literal into a decimal. The lexical value of this literal should be in the lexical space of the decimal datatype ("https://www.w3.org/TR/owl2-syntax/#Floating-Point_Numbers").

Returns

A decimal value that is represented by this literal.

is_integer() → bool

Whether this literal is typed as integer.

parse_integer() → int

Parses the lexical value of this literal into an integer. The lexical value of this literal should be in the lexical space of the integer datatype ("<http://www.w3.org/2001/XMLSchema#integer>").

Returns

An integer value that is represented by this literal.

is_string() → bool

Whether this literal is typed as string.

parse_string() → str

Parses the lexical value of this literal into a string. The lexical value of this literal should be in the lexical space of the string datatype ("<http://www.w3.org/2001/XMLSchema#string>").

Returns

A string value that is represented by this literal.

is_date() → bool

Whether this literal is typed as date.

parse_date() → datetime.date

Parses the lexical value of this literal into a date. The lexical value of this literal should be in the lexical space of the date datatype ("<http://www.w3.org/2001/XMLSchema#date>").

Returns

A date value that is represented by this literal.

is_datetime() → bool

Whether this literal is typed as dateTime.

parse_datetime() → datetime.datetime

Parses the lexical value of this literal into a datetime. The lexical value of this literal should be in the lexical space of the dateTime datatype ("<http://www.w3.org/2001/XMLSchema#dateTime>").

Returns

A datetime value that is represented by this literal.

is_duration() → bool

Whether this literal is typed as duration.

parse_duration() → pandas.Timedelta

Parses the lexical value of this literal into a Timedelta. The lexical value of this literal should be in the lexical space of the duration datatype ("<http://www.w3.org/2001/XMLSchema#duration>").

Returns

A Timedelta value that is represented by this literal.

is_time() → bool

Whether this literal is typed as time.

parse_time() → datetime.time

Parses the lexical value of this literal into time. The lexical value of this literal should be in the lexical space of the time datatype ("<http://www.w3.org/2001/XMLSchema#time>").

Returns

A time value that is represented by this literal.

is_gyearmonth() → bool

Whether this literal is typed as gYearMonth.

parse_gyearmonth() → tuple

Parses the lexical value of this literal into gYearMonth.

Returns

A tuple value of length 2 that is represented by this literal.

is_gmonthday() → bool

Whether this literal is typed as gMonthDay.

parse_gmonthday() → tuple

Parses the lexical value of this literal into gMonthDay.

Returns

A tuple value of length 2 that is represented by this literal.

is_gyear() → bool

Whether this literal is typed as gYear.

parse_gyear() → tuple

Parses the lexical value of this literal into gYear.

Returns

A integer value that is represented by this literal.

is_gmonth() → bool

Whether this literal is typed as gMonth.

parse_gmonth() → tuple

Parses the lexical value of this literal into gMonth.

Returns

A integer value that is represented by this literal.

is_gday() → bool

Whether this literal is typed as gDay.

parse_gday() → tuple

Parses the lexical value of this literal into gDay.

Returns

A integer value that is represented by this literal.

has_float_special_value() → bool

Whether this literal is using a float special value i.e. $v \in [\text{"NaN"}, \text{"INF"}, \text{"-INF"}]$, defined by and enumeration class (not pure string value).

is_literal() → bool

Returns

true if the annotation value is a literal

as_literal() → *OWLLiteral*

Returns

if the value is a literal, returns it. Return None otherwise

to_python() → Literals

abstract get_datatype() → *owlapy.owl_datatype.OWLDatatype*

Gets the OWLDatatype which types this literal.

Returns

The OWLDatatype that types this literal.

owlapy.owl_object

OWL Base classes

Classes

<i>OWLObject</i>	Base interface for OWL objects
<i>OWLObjectRenderer</i>	Abstract class with a render method to render an OWL Object into a string.
<i>OWLObjectParser</i>	Abstract class with a parse method to parse a string to an OWL Object.
<i>OWLNamedObject</i>	Represents a named object for example, class, property, ontology etc. - i.e. anything that has an
<i>OWLEntity</i>	Represents Entities in the OWL 2 Specification.

Module Contents

class owlapy.owl_object.OWLObject

Base interface for OWL objects

__slots__ = ()

abstract **__eq__**(other)

abstract **__hash__**()

abstract **__repr__**()

is_anonymous() → bool

class owlapy.owl_object.OWLObjectRenderer

Abstract class with a render method to render an OWL Object into a string.

abstract **set_short_form_provider** (*short_form_provider*) → None

Configure a short form provider that shortens the OWL objects during rendering.

Parameters

short_form_provider – Short form provider.

abstract **render** (*o: OWLObject*) → str

Render OWL Object to string.

Parameters

o – OWL Object.

Returns

String rendition of OWL object.

class owlapy.owl_object.**OWLObjectParser**

Abstract class with a parse method to parse a string to an OWL Object.

abstract **parse_expression** (*expression_str: str*) → *OWLObject*

Parse a string to an OWL Object.

Parameters

expression_str (*str*) – Expression string.

Returns

The OWL Object which is represented by the string.

class owlapy.owl_object.**OWLNamedObject**

Bases: *OWLObject*, *owlapy.meta_classes.HasIRI*

Represents a named object for example, class, property, ontology etc. - i.e. anything that has an IRI as its name.

__slots__ = ()

__eq__ (*other*)

__lt__ (*other*)

__hash__ ()

__repr__ ()

class owlapy.owl_object.**OWLEntity**

Bases: *OWLNamedObject*

Represents Entities in the OWL 2 Specification.

__slots__ = ()

to_string_id () → str

is_anonymous () → bool

owlapy.owl_ontology

OWL Ontology

Attributes

<code>logger</code>
<code>OWLREADY2_FACET_KEYS</code>

Classes

<code>OWLOntologyID</code>	An object that identifies an ontology. Since OWL 2, ontologies do not have to have an ontology IRI, or if they
<code>Ontology</code>	Represents an OWL 2 Ontology in the OWL 2 specification.
<code>SyncOntology</code>	Represents an OWL 2 Ontology in the OWL 2 specification.
<code>RDFLibOntology</code>	Represents an OWL 2 Ontology in the OWL 2 specification.
<code>ToOwlready2</code>	
<code>FromOwlready2</code>	Map owlready2 classes to owlapy model classes.

Module Contents

`owlapy.owl_ontology.logger`

```
class owlapy.owl_ontology.OWLOntologyID(ontology_iri: owlapy.iri.IRI | None = None,  
                                           version_iri: owlapy.iri.IRI | None = None)
```

An object that identifies an ontology. Since OWL 2, ontologies do not have to have an ontology IRI, or if they have an ontology IRI then they can optionally also have a version IRI. Instances of this OWLOntologyID class bundle identifying information of an ontology together. If an ontology doesn't have an ontology IRI then we say that it is "anonymous".

```
__slots__ = ('_ontology_iri', '_version_iri')
```

```
get_ontology_iri() → owlapy.iri.IRI | None
```

Gets the ontology IRI.

Returns

Ontology IRI. If the ontology is anonymous, it will return None.

```
get_version_iri() → owlapy.iri.IRI | None
```

Gets the version IRI.

Returns

Version IRI or None.

```
get_default_document_iri() → owlapy.iri.IRI | None
```

Gets the IRI which is used as a default for the document that contain a representation of an ontology with this ID. This will be the version IRI if there is an ontology IRI and version IRI, else it will be the ontology IRI if there is an ontology IRI but no version IRI, else it will be None if there is no ontology IRI. See Ontology Documents in the OWL 2 Structural Specification.

Returns

the IRI that can be used as a default for an ontology document, or None.

`is_anonymous() → bool`

`__repr__()`

`__eq__(other)`

class `owlapy.owl_ontology.Ontology` (*manager: OM, ontology_iri: owlapy.iri.IRI | str, load: bool*)

Bases: `owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology`

Represents an OWL 2 Ontology in the OWL 2 specification.

An OWLontology consists of a possibly empty set of OWLAxioms and a possibly empty set of OWLAnnotations. An ontology can have an ontology IRI which can be used to identify the ontology. If it has an ontology IRI then it may also have an ontology version IRI. Since OWL 2, an ontology need not have an ontology IRI. (See the OWL 2 Structural Specification).

An ontology cannot be modified directly. Changes must be applied via its OWLontologyManager.

`__slots__ = ('_manager', '_iri', '_world', '_onto', 'is_modified')`

`is_modified: bool`

`__len__() → int`

`classes_in_signature() → Iterable[owlapy.class_expression.OWLClass]`

Gets the classes in the signature of this object.

Returns

Classes in the signature of this object.

`data_properties_in_signature() → Iterable[owlapy.owl_property.OWLDataProperty]`

Get the data properties that are in the signature of this object.

Returns

Data properties that are in the signature of this object.

`object_properties_in_signature() → Iterable[owlapy.owl_property.OWLObjectProperty]`

A convenience method that obtains the object properties that are in the signature of this object.

Returns

Object properties that are in the signature of this object.

`properties_in_signature() → Iterable[owlapy.owl_property.OWLProperty]`

`individuals_in_signature() → Iterable[owlapy.owl_individual.OWLNamedIndividual]`

A convenience method that obtains the individuals that are in the signature of this object.

Returns

Individuals that are in the signature of this object.

abstract `get_abox_axioms() → Iterable`

abstract `get_tbox_axioms() → Iterable`

abstract `get_abox_axioms_between_individuals() → Iterable`

abstract `get_abox_axioms_between_individuals_and_classes() → Iterable`

equivalent_classes_axioms (*c*: *owlapy.class_expression.OWLClass*)
→ Iterable[*owlapy.owl_axiom.OWLEquivalentClassesAxiom*]

Gets all of the equivalent axioms in this ontology that contain the specified class as an operand.

Parameters

c – The class for which the EquivalentClasses axioms should be retrieved.

Returns

EquivalentClasses axioms contained in this ontology.

general_class_axioms () → Iterable[*owlapy.owl_axiom.OWLClassAxiom*]

Get the general class axioms of this ontology. This includes SubClass axioms with a complex class expression

as the sub class and EquivalentClass axioms and DisjointClass axioms with only complex class expressions.

Returns

General class axioms contained in this ontology.

get_owl_ontology_manager () → *_OM*

Gets the manager that manages this ontology.

get_ontology_id () → *OWLOntologyID*

Gets the OWLOntologyID belonging to this object.

Returns

The OWLOntologyID.

data_property_domain_axioms (*pe*: *owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyDomainAxiom*]

Gets the OWLDataPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

data_property_range_axioms (*pe*: *owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyRangeAxiom*]

Gets the OWLDataPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

object_property_domain_axioms (*pe*: *owlapy.owl_property.OWLObjectProperty*)
→ Iterable[*owlapy.owl_axiom.OWLObjectPropertyDomainAxiom*]

Gets the OWLObjectPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

object_property_range_axioms (*pe: owlapy.owl_property.OWLObjectProperty*)
→ *Iterable[owlapy.owl_axiom.OWLObjectPropertyRangeAxiom]*

Gets the OWLObjectPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

add_axiom (*axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom]*)

Add the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

remove_axiom (*axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom]*)

Removes the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

save (*path: str | owlapy.iri.IRI = None, inplace: bool = False, rdf_format='rdxml'*)

Saves this ontology, using its IRI to determine where/how the ontology should be saved.

Parameters

document_iri – Whether you want to save in a different location.

get_original_iri ()

Get the IRI argument that was used to create this ontology.

__eq__ (*other*)

__hash__ ()

__repr__ ()

class owlapy.owl_ontology.SyncOntology (*manager: _SM, path: owlapy.iri.IRI | str,*
new: bool = False)

Bases: *owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology*

Represents an OWL 2 Ontology in the OWL 2 specification.

An OWLontology consists of a possibly empty set of OWLAxioms and a possibly empty set of OWLAnnotations. An ontology can have an ontology IRI which can be used to identify the ontology. If it has an ontology IRI then it may also have an ontology version IRI. Since OWL 2, an ontology need not have an ontology IRI. (See the OWL 2 Structural Specification).

An ontology cannot be modified directly. Changes must be applied via its OWLontologyManager.

manager

path

new = False

mapper

__eq__(*other*)

__hash__()

__repr__()

__len__()

classes_in_signature() → Iterable[*owlapy.class_expression.OWLClass*]

Gets the classes in the signature of this object.

Returns

Classes in the signature of this object.

data_properties_in_signature() → Iterable[*owlapy.owl_property.OWLDataProperty*]

Get the data properties that are in the signature of this object.

Returns

Data properties that are in the signature of this object.

object_properties_in_signature() → Iterable[*owlapy.owl_property.OWLObjectProperty*]

A convenience method that obtains the object properties that are in the signature of this object.

Returns

Object properties that are in the signature of this object.

individuals_in_signature() → Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

A convenience method that obtains the individuals that are in the signature of this object.

Returns

Individuals that are in the signature of this object.

equivalent_classes_axioms(*c: owlapy.class_expression.OWLClass*)
→ Iterable[*owlapy.owl_axiom.OWLEquivalentClassesAxiom*]

Gets all of the equivalent axioms in this ontology that contain the specified class as an operand.

Parameters

c – The class for which the EquivalentClasses axioms should be retrieved.

Returns

EquivalentClasses axioms contained in this ontology.

general_class_axioms() → Iterable[*owlapy.owl_axiom.OWLClassAxiom*]

Get the general class axioms of this ontology. This includes SubClass axioms with a complex class expression

as the sub class and EquivalentClass axioms and DisjointClass axioms with only complex class expressions.

Returns

General class axioms contained in this ontology.

data_property_domain_axioms(*property: owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyDomainAxiom*]

Gets the OWLDataPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

data_property_range_axioms (*property: owlapy.owl_property.OWLDataProperty*)
 → Iterable[*owlapy.owl_axiom.OWLDataPropertyRangeAxiom*]

Gets the OWLDataPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

object_property_domain_axioms (*property: owlapy.owl_property.OWLObjectProperty*)
 → Iterable[*owlapy.owl_axiom.OWLObjectPropertyDomainAxiom*]

Gets the OWLObjectPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

object_property_range_axioms (*property: owlapy.owl_property.OWLObjectProperty*)
 → Iterable[*owlapy.owl_axiom.OWLObjectPropertyRangeAxiom*]

Gets the OWLObjectPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

get_signature (*include_imports_closure: bool = True*)

Gets the entities that are in the signature of this ontology.

Parameters

include_imports_closure – Whether to include/exclude imports from searches.

Returns

Entities in signature.

get_abox_axioms (*include_imports_closure: bool = True*) → Iterable[*owlapy.owl_axiom.OWLAxiom*]

Get all ABox axioms.

Parameters

include_imports_closure – Whether to include/exclude imports from searches.

Returns

ABox axioms.

get_tbox_axioms (*include_imports_closure: bool = True*) → Iterable[*owlapy.owl_axiom.OWLAxiom*]

Get all TBox axioms.

Parameters

include_imports_closure – Whether to include/exclude imports from searches.

Returns

TBox axioms.

get_owl_ontology_manager() → *_M*

Gets the manager that manages this ontology.

get_owlapi_ontology()

get_ontology_id() → *OWLOntologyID*

Gets the OWLOntologyID belonging to this object.

Returns

The OWLOntologyID.

add_axiom (*axiom*: *owlapy.owl_axiom.OWLXiom* | *Iterable[owlapy.owl_axiom.OWLXiom]*)

Add the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

remove_axiom (*axiom*: *owlapy.owl_axiom.OWLXiom* | *Iterable[owlapy.owl_axiom.OWLXiom]*)

Removes the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

save (*path*: *str* = *None*, *document_iri*: *owlapy.iri.IRI* | *None* = *None*)

<https://github.com/philord/owl-api/blob/b2a5bf9a0c6730c8ff950776af8f9bf19c78eac/contract/src/test/java/org/coode/owlapi/examples/Examples.java#L206>

class *owlapy.owl_ontology.RDFLibOntology* (*path*: *str*)

Bases: *owlapy.abstracts.abstract_owl_ontology.AbstractOWLOntology*

Represents an OWL 2 Ontology in the OWL 2 specification.

An OWLOntology consists of a possibly empty set of OWLXioms and a possibly empty set of OWLAnnotations. An ontology can have an ontology IRI which can be used to identify the ontology. If it has an ontology IRI then it may also have an ontology version IRI. Since OWL 2, an ontology need not have an ontology IRI. (See the OWL 2 Structural Specification).

An ontology cannot be modified directly. Changes must be applied via its OWLOntologyManager.

get_abox_axioms () → *Iterable*

abstract classes_in_signature () → Iterable[*owlapy.class_expression.OWLClass*]

Gets the classes in the signature of this object.

Returns

Classes in the signature of this object.

abstract data_properties_in_signature () → Iterable[*owlapy.owl_property.OWLDataProperty*]

Get the data properties that are in the signature of this object.

Returns

Data properties that are in the signature of this object.

abstract object_properties_in_signature ()
→ Iterable[*owlapy.owl_property.OWLObjectProperty*]

A convenience method that obtains the object properties that are in the signature of this object.

Returns

Object properties that are in the signature of this object.

abstract properties_in_signature () → Iterable[*owlapy.owl_property.OWLProperty*]

abstract individuals_in_signature () → Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

A convenience method that obtains the individuals that are in the signature of this object.

Returns

Individuals that are in the signature of this object.

abstract get_abox_axioms_between_individuals () → Iterable

abstract get_abox_axioms_between_individuals_and_classes () → Iterable

abstract equivalent_classes_axioms (c: *owlapy.class_expression.OWLClass*)
→ Iterable[*owlapy.owl_axiom.OWLEquivalentClassesAxiom*]

Gets all of the equivalent axioms in this ontology that contain the specified class as an operand.

Parameters

c – The class for which the EquivalentClasses axioms should be retrieved.

Returns

EquivalentClasses axioms contained in this ontology.

abstract general_class_axioms () → Iterable[*owlapy.owl_axiom.OWLClassAxiom*]

Get the general class axioms of this ontology. This includes SubClass axioms with a complex class expression

as the sub class and EquivalentClass axioms and DisjointClass axioms with only complex class expressions.

Returns

General class axioms contained in this ontology.

abstract data_property_domain_axioms (pe: *owlapy.owl_property.OWLDataProperty*)
→ Iterable[*owlapy.owl_axiom.OWLDataPropertyDomainAxiom*]

Gets the OWLDataPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract data_property_range_axioms (pe: owlapy.owl_property.OWLDataProperty)
    → Iterable[owlapy.owl_axiom.OWLDataPropertyRangeAxiom]
```

Gets the OWLDataPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract object_property_domain_axioms (pe: owlapy.owl_property.OWLObjectProperty)
    → Iterable[owlapy.owl_axiom.OWLObjectPropertyDomainAxiom]
```

Gets the OWLObjectPropertyDomainAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract object_property_range_axioms (pe: owlapy.owl_property.OWLObjectProperty)
    → Iterable[owlapy.owl_axiom.OWLObjectPropertyRangeAxiom]
```

Gets the OWLObjectPropertyRangeAxiom objects where the property is equal to the specified property.

Parameters

property – The property which is equal to the property of the retrieved axioms.

Returns

The axioms matching the search.

```
abstract add_axiom (
    axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom])
```

Add the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

```
abstract remove_axiom (
    axiom: owlapy.owl_axiom.OWLAxiom | Iterable[owlapy.owl_axiom.OWLAxiom])
```

Removes the specified axiom/axioms to the ontology.

Parameters

axiom – Can be a single axiom or a collection of axioms.

Returns

Nothing.

```
abstract save (path: str | owlapy.iri.IRI = None, inplace: bool = False, rdf_format='rdxml')
```

Saves this ontology, using its IRI to determine where/how the ontology should be saved.

Parameters

document_iri – Whether you want to save in a different location.

```
abstract get_ontology_id ()
```

Gets the OWLOntologyID belonging to this object.

Returns

The OWLOntologyID.

```

abstract get_owl_ontology_manager()
    Gets the manager that manages this ontology.

abstract __eq__(other)

abstract __hash__()

abstract __repr__()

owlapy.owl_ontology.OWLREADY2_FACET_KEYS

class owlapy.owl_ontology.ToOwlready2(world: owlready2.World)

    __slots__ = '_world'

    abstract map_object(o: owlapy.owl_object.OWLObject)
        Map owlapy object classes.

    abstract map_concept(o: owlapy.class_expression.OWLClassExpression)
        → owlready2.ClassConstruct | owlready2.ThingClass
        Map owlapy concept classes.

    abstract map_datarange(p: owlapy.owl_data_ranges.OWLDataRange)
        → owlready2.ClassConstruct | type
        Map owlapy data range classes.

class owlapy.owl_ontology.FromOwlready2
    Map owlready2 classes to owlapy model classes.

    __slots__ = ()

    abstract map_concept(c: owlready2.ClassConstruct | owlready2.ThingClass)

owlapy.owl_ontology_manager

Classes

<i>OWLImportsDeclaration</i>	Represents an import statement in an ontology.
<i>AddImport</i>	Represents an ontology change where an import statement is added to an ontology.
<i>OntologyManager</i>	An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing
<i>SyncOntologyManager</i>	Create OWLManager in Python
<i>RDFLibOntologyManager</i>	An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing

Module Contents

```

class owlapy.owl_ontology_manager.OWLImportsDeclaration (import_iri: owlapy.iri.IRI)
    Bases: owlapy.meta_classes.HasIRI

    Represents an import statement in an ontology.

    __slots__ = '_iri'

    property iri: owlapy.iri.IRI
        Gets the import IRI.

        Returns
            The import IRI that points to the ontology to be imported. The imported ontology might have
            this IRI as its ontology IRI but this is not mandated. For example, an ontology with a non-
            resolvable ontology IRI can be deployed at a resolvable URL.

    property str: str
        Gets the string representation of this object

        Returns
            The IRI as string

```

```

class owlapy.owl_ontology_manager.AddImport (
    ontology: owlapy.abstracts.abstract_owl_ontology.AbstractOWL ontology,
    import_declaration: OWLImportsDeclaration)
    Bases: owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWL ontologyChange

    Represents an ontology change where an import statement is added to an ontology.

    __slots__ = ('_ont', '_declaration')

    get_import_declaration() → OWLImportsDeclaration
        Gets the import declaration that the change pertains to.

        Returns
            The import declaration.

```

```

class owlapy.owl_ontology_manager.OntologyManager (world_store=None)
    Bases: owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWL ontologyManager

    An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing
    ontologies.

    __slots__ = '_world'

    create_ontology (iri: str | owlapy.iri.IRI = None) → owlapy.owl_ontology.Ontology
        Creates a new (empty) ontology that that has the specified ontology IRI (and no version IRI).

        Parameters
            iri – The IRI of the ontology to be created, can also be a string.

        Returns
            The newly created ontology.

    load_ontology (path: str = None) → owlapy.owl_ontology.Ontology
        Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology
        IRI will be mapped to an ontology document IRI.

        Parameters
            iri –

            The IRI that identifies the ontology, can also be a string.
            It is expected that the ontology will also have this IRI

```

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

apply_change (*change*: *owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyChange*)

A convenience method that applies just one change to an ontology. When this method is used through an OWLOntologyManager implementation, the instance used should be the one that the ontology returns through the `get_owl_ontology_manager()` call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

save_world()

Saves the actual state of the quadstore in the SQLite3 file.

class `owlapy.owl_ontology_manager.SyncOntologyManager`

Bases: *owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyManager*

Create OWLManager in Python https://owlcs.github.io/owlapi/apidocs_5/org/semanticweb/owlapi/apibinding/OWLManager.html

owlapi_manager

create_ontology (*iri*: *owlapy.iri.IRI* | *str*) → *owlapy.owl_ontology.SyncOntology*

Creates a new (empty) ontology that has the specified ontology IRI (and no version IRI).

Parameters

iri – The IRI of the ontology to be created, can also be a string.

Returns

The newly created ontology.

load_ontology (*path*: *str*) → *owlapy.owl_ontology.SyncOntology*

Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology IRI will be mapped to an ontology document IRI.

Parameters

iri –

The IRI that identifies the ontology, can also be a string.

It is expected that the ontology will also have this IRI

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

get_owlapi_manager()

abstract apply_change (*change*: *owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyChange*)

A convenience method that applies just one change to an ontology. When this method is used through an OWLOntologyManager implementation, the instance used should be the one that the ontology returns through the `get_owl_ontology_manager()` call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

getOntologyFormat (*args)

saveOntology (*args) → None

class owlapy.owl_ontology_manager.**RDFLibOntologyManager**

Bases: *owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLOntologyManager*

An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing ontologies.

create_ontology (iri: str = None) → *owlapy.owl_ontology.RDFLibOntology*

Creates a new (empty) ontology that has the specified ontology IRI (and no version IRI).

Parameters

iri – The IRI of the ontology to be created, can also be a string.

Returns

The newly created ontology.

load_ontology (path: str = None) → *owlapy.owl_ontology.Ontology*

Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology IRI will be mapped to an ontology document IRI.

Parameters

iri –

The IRI that identifies the ontology, can also be a string.

It is expected that the ontology will also have this IRI

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

abstract **apply_change** (

change: owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLOntologyChange)

A convenience method that applies just one change to an ontology. When this method is used through an OWLOntologyManager implementation, the instance used should be the one that the ontology returns through the get_owl_ontology_manager() call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

abstract **save_world** ()

owlapy.owl_property

OWL Properties

Classes

<i>OWLPropertyExpression</i>	Represents a property or possibly the inverse of a property.
<i>OWLObjectPropertyExpression</i>	A high level interface to describe different types of object properties.
<i>OWLDataPropertyExpression</i>	A high level interface to describe different types of data properties.
<i>OWLProperty</i>	A base class for properties that aren't expression i.e. named properties. By definition, properties
<i>OWLObjectProperty</i>	Represents an Object Property in the OWL 2 Specification. Object properties connect pairs of individuals.
<i>OWLObjectInverseOf</i>	Represents the inverse of a property expression (ObjectInverseOf). An inverse object property expression
<i>OWLDataProperty</i>	Represents a Data Property in the OWL 2 Specification. Data properties connect individuals with literals.

Module Contents

class owlapy.owl_property.OWLPropertyExpression

Bases: *owlapy.owl_object.OWLObject*

Represents a property or possibly the inverse of a property.

__slots__ = ()

is_data_property_expression() → bool

Returns

True if this is a data property.

is_object_property_expression() → bool

Returns

True if this is an object property.

is_owl_top_object_property() → bool

Determines if this is the owl:topObjectProperty.

Returns

topObjectProperty.

Return type

True if this property is the owl

is_owl_top_data_property() → bool

Determines if this is the owl:topDataProperty.

Returns

topDataProperty.

Return type

True if this property is the owl

class owlapy.owl_property.OWLObjectPropertyExpression

Bases: *OWLPropertyExpression*

A high level interface to describe different types of object properties.

```

__slots__ = ()

abstract get_inverse_property() → OWLObjectPropertyExpression
    Obtains the property that corresponds to the inverse of this property.

    Returns
        The inverse of this property. Note that this property will not necessarily be in the simplest form.

abstract get_named_property() → OWLObjectProperty
    Get the named object property used in this property expression.

    Returns
        P if this expression is either inv(P) or P.

is_object_property_expression() → bool

    Returns
        True if this is an object property.

class owlapy.owl_property.OWLDataPropertyExpression
    Bases: OWLPropertyExpression
    A high level interface to describe different types of data properties.

    __slots__ = ()

    is_data_property_expression()

    Returns
        True if this is a data property.

class owlapy.owl_property.OWLProperty(iri: owlapy.iri.IRI | str)
    Bases: OWLPropertyExpression, owlapy.owl_object.OWLEntity
    A base class for properties that aren't expression i.e. named properties. By definition, properties are either data
    properties or object properties.

    __slots__ = '_iri'

    property str: str
        Gets the string representation of this object

    Returns
        The IRI as string

    property iri: owlapy.iri.IRI
        Gets the IRI of this object.

    Returns
        The IRI of this object.

class owlapy.owl_property.OWLObjectProperty(iri: owlapy.iri.IRI | str)
    Bases: OWLObjectPropertyExpression, OWLProperty
    Represents an Object Property in the OWL 2 Specification. Object properties connect pairs of individuals.
    (https://www.w3.org/TR/owl2-syntax/#Object\_Properties)

    __slots__ = '_iri'

    type_index: Final = 1002

```

property reminder

get_named_property () → *OWLObjectProperty*

Get the named object property used in this property expression.

Returns

P if this expression is either inv(P) or P.

get_inverse_property () → *OWLObjectInverseOf*

Obtains the property that corresponds to the inverse of this property.

Returns

The inverse of this property. Note that this property will not necessarily be in the simplest form.

is_owl_top_object_property () → bool

Determines if this is the owl:topObjectProperty.

Returns

topObjectProperty.

Return type

True if this property is the owl

class owlapy.owl_property.OWLObjectInverseOf (property: *OWLObjectProperty*)

Bases: *OWLObjectPropertyExpression*

Represents the inverse of a property expression (ObjectInverseOf). An inverse object property expression ObjectInverseOf(P) connects an individual I1 with I2 if and only if the object property P connects I2 with I1. This can be used to refer to the inverse of a property, without actually naming the property. For example, consider the property hasPart, the inverse property of hasPart (isPartOf) can be referred to using this interface inverseOf(hasPart), which can be used in restrictions e.g. inverseOf(hasPart) some Car refers to the set of things that are part of at least one car.

(https://www.w3.org/TR/owl2-syntax/#Inverse_Object_Properties)

__slots__ = '_inverse_property'

type_index: Final = 1003

get_inverse () → *OWLObjectProperty*

Gets the property expression that this is the inverse of.

Returns

The object property expression such that this object property expression is an inverse of it.

get_inverse_property () → *OWLObjectProperty*

Obtains the property that corresponds to the inverse of this property.

Returns

The inverse of this property. Note that this property will not necessarily be in the simplest form.

get_named_property () → *OWLObjectProperty*

Get the named object property used in this property expression.

Returns

P if this expression is either inv(P) or P.

__repr__ ()

__eq__ (other)

`__hash__()`

class owlapy.owl_property.OWLDataProperty(*iri: owlapy.iri.IRI | str*)

Bases: *OWLDataPropertyExpression, OWLProperty*

Represents a Data Property in the OWL 2 Specification. Data properties connect individuals with literals. In some knowledge representation systems, functional data properties are called attributes.

(https://www.w3.org/TR/owl2-syntax/#Data_Properties)

`__slots__ = '_iri'`

`type_index: Final = 1004`

`is_owl_top_data_property() → bool`

Determines if this is the owl:topDataProperty.

Returns

topDataProperty.

Return type

True if this property is the owl

owlapy.owl_reasoner

OWL Reasoner

Attributes

logger

Classes

StructuralReasoner

Tries to check instances fast (but maybe incomplete).

SyncReasoner

An OWLReasoner reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of

Functions

initialize_reasoner(reasoner, owlapi_ontology)

import_and_include_axioms_generators()

Module Contents

owlapy.owl_reasoner.logger

```
class owlapy.owl_reasoner.StructuralReasoner (
    ontology: owlapy.abstracts.abstract_owl_ontology.AbstractOWL ontology, *,
    class_cache: bool = True, property_cache: bool = True, negation_default: bool = True,
    sub_properties: bool = False)
```

Bases: `owlapy.abstracts.abstract_owl_reasoner.AbstractOWLReasoner`

Tries to check instances fast (but maybe incomplete).

class_cache: bool = True

reset()

The reset method shall reset any cached state.

data_property_domains (pe: `owlapy.owl_property.OWLDataProperty`, direct: bool = False)
 → Iterable[`owlapy.class_expression.OWLClassExpression`]

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let N = `equivalent_classes(DataSomeValuesFrom(pe rdfs:Literal))`. If direct is True: then if N is not empty then the return value is N, else the return value is the result of `super_classes(DataSomeValuesFrom(pe rdfs:Literal), true)`. If direct is False: then the result of `super_classes(DataSomeValuesFrom(pe rdfs:Literal), false)` together with N if N is non-empty. (Note, `rdfs:Literal` is the top datatype).

object_property_domains (pe: `owlapy.owl_property.OWLObjectProperty`, direct: bool = False)
 → Iterable[`owlapy.class_expression.OWLClassExpression`]

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let N = `equivalent_classes(ObjectSomeValuesFrom(pe owl:Thing))`. If direct is True: then if N is not empty then the return value is N, else the return value is the result of `super_classes(ObjectSomeValuesFrom(pe owl:Thing), true)`. If direct is False: then the result of `super_classes(ObjectSomeValuesFrom(pe owl:Thing), false)` together with N if N is non-empty.

object_property_ranges (pe: `owlapy.owl_property.OWLObjectProperty`, direct: bool = False)
 → Iterable[`owlapy.class_expression.OWLClassExpression`]

Gets the class expressions that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns

Let $N = \text{equivalent_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe}) \text{ owl:Thing}))$. If **direct** is True: then if N is not empty then the return value is N , else the return value is the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe}) \text{ owl:Thing}), \text{true})$. If **direct** is False: then the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe}) \text{ owl:Thing}), \text{false})$ together with N if N is non-empty.

data_property_ranges (*pe: owlapy.owl_property.OWLDataProperty, direct: bool = True*)
→ Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the data ranges that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **pe** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns:

equivalent_classes (*ce: owlapy.class_expression.OWLClassExpression, only_named: bool = True*)
→ Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are equivalent to the specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose equivalent classes are to be retrieved.

Returns

All class expressions C where the root ontology imports closure entails $\text{EquivalentClasses}(ce \ C)$. If ce is not a class name (i.e. it is an anonymous class expression) and there are no such classes C then there will be no result. If ce is unsatisfiable with respect to the set of reasoner axioms then owl:Nothing , i.e. the bottom node, will be returned.

disjoint_classes (*ce: owlapy.class_expression.OWLClassExpression, only_named: bool = True*)
→ Iterable[*owlapy.class_expression.OWLClassExpression*]

Gets the class expressions that are disjoint with specified class expression with respect to the set of reasoner axioms.

Parameters

ce – The class expression whose disjoint classes are to be retrieved.

Returns

All class expressions D where the set of reasoner axioms entails $\text{EquivalentClasses}(D \ \text{Object-ComplementOf}(ce))$ or $\text{StrictSubClassOf}(D \ \text{ObjectComplementOf}(ce))$.

different_individuals (*ind: owlapy.owl_individual.OWLNamedIndividual*)
→ Iterable[*owlapy.owl_individual.OWLNamedIndividual*]

Gets the individuals that are different from the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose different individuals are to be retrieved.

Returns

All individuals x where the set of reasoner axioms entails `DifferentIndividuals(ind x)`.

same_individuals (*ind*: *owlapy.owl_individual.OWLNamedIndividual*)
→ *Iterable[owlapy.owl_individual.OWLNamedIndividual]*

Gets the individuals that are the same as the specified individual with respect to the set of reasoner axioms.

Parameters

ind – The individual whose same individuals are to be retrieved.

Returns

All individuals x where the root ontology imports closure entails `SameIndividual(ind x)`.

data_property_values (*e*: *owlapy.owl_object.OWLEntity*, *pe*: *owlapy.owl_property.OWLDataProperty*,
direct: *bool = True*) → *Iterable[owlapy.owl_literal.OWLLiteral]*

Gets the data property values for the specified entity and data property expression.

Parameters

- **e** – The owl entity (usually an individual) that is the subject of the data property values.
- **pe** – The data property expression whose values are to be retrieved for the specified entity.

Note: Can be used to get values, for example, of ‘label’ property of owl entities such as classes and properties too (not only individuals).

Returns

A set of OWLLiterals containing literals such that for each literal l in the set, the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)`.

all_data_property_values (*pe*: *owlapy.owl_property.OWLDataProperty*, *direct*: *bool = True*)
→ *Iterable[owlapy.owl_literal.OWLLiteral]*

Gets all values for the given data property expression that appear in the knowledge base.

Parameters

- **pe** – The data property expression whose values are to be retrieved
- **direct** – Specifies if only the direct values of the data property pe should be retrieved (True), or if the values of sub properties of pe should be taken into account (False).

Returns

A set of OWLLiterals containing literals such that for each literal l in the set, the set of reasoner axioms entails `DataPropertyAssertion(pe ind l)` for any ind.

object_property_values (*ind*: *owlapy.owl_individual.OWLNamedIndividual*,
pe: *owlapy.owl_property.OWLObjectPropertyExpression*, *direct*: *bool = False*)
→ *Iterable[owlapy.owl_individual.OWLNamedIndividual]*

Gets the object property values for the specified individual and object property expression.

Parameters

- **ind** – The individual that is the subject of the object property values.
- **pe** – The object property expression whose values are to be retrieved for the specified individual.

Returns

The named individuals such that for each individual j, the set of reasoner axioms entails `ObjectPropertyAssertion(pe ind j)`.

instances (*ce: owlapy.class_expression.OWLClassExpression, direct: bool = False, timeout: int = 1000*)

Gets the individuals which are instances of the specified class expression.

Parameters

- **ce** – The class expression whose instances are to be retrieved.
- **direct** – Specifies if the direct instances should be retrieved (True), or if all instances should be retrieved (False).
- **timeout** – Time limit in seconds until results must be returned, else empty set is returned.

Returns

If **direct** is True, each named individual *j* where the set of reasoner axioms entails `DirectClassAssertion(ce, j)`. If **direct** is False, each named individual *j* where the set of reasoner axioms entails `ClassAssertion(ce, j)`. If *ce* is unsatisfiable with respect to the set of reasoner axioms then nothing returned.

sub_classes (*ce: owlapy.class_expression.OWLClassExpression, direct: bool = False, only_named: bool = True*) → `Iterable[owlapy.class_expression.OWLClassExpression]`

Gets the set of named classes that are the strict (potentially direct) subclasses of the specified class expression with respect to the reasoner axioms.

Parameters

- **ce** – The class expression whose strict (direct) subclasses are to be retrieved.
- **direct** – Specifies if the direct subclasses should be retrieved (True) or if the all subclasses (descendant) classes should be retrieved (False).

Returns

If **direct** is True, each class *C* where reasoner axioms entails `DirectSubClassOf(C, ce)`. If **direct** is False, each class *C* where reasoner axioms entails `StrictSubClassOf(C, ce)`. If *ce* is equivalent to `owl:Nothing` then nothing will be returned.

super_classes (*ce: owlapy.class_expression.OWLClassExpression, direct: bool = False, only_named: bool = True*) → `Iterable[owlapy.class_expression.OWLClassExpression]`

Gets the stream of named classes that are the strict (potentially direct) super classes of the specified class expression with respect to the imports closure of the root ontology.

Parameters

- **ce** – The class expression whose strict (direct) super classes are to be retrieved.
- **direct** – Specifies if the direct super classes should be retrieved (True) or if the all super classes (ancestors) classes should be retrieved (False).

Returns

If **direct** is True, each class *C* where the set of reasoner axioms entails `DirectSubClassOf(ce, C)`. If **direct** is False, each class *C* where set of reasoner axioms entails `StrictSubClassOf(ce, C)`. If *ce* is equivalent to `owl:Thing` then nothing will be returned.

equivalent_object_properties (*op: owlapy.owl_property.OWLObjectPropertyExpression*) → `Iterable[owlapy.owl_property.OWLObjectPropertyExpression]`

Gets the simplified object properties that are equivalent to the specified object property with respect to the set of reasoner axioms.

Parameters

- **op** – The object property whose equivalent object properties are to be retrieved.

Returns

All simplified object properties *e* where the root ontology imports closure entails `EquivalentObjectProperties(op e)`. If *op* is unsatisfiable with respect to the set of reasoner axioms then `owl:bottomDataProperty` will be returned.

equivalent_data_properties (*dp*: `owlapy.owl_property.OWLDataProperty`)
→ `Iterable[owlapy.owl_property.OWLDataProperty]`

Gets the data properties that are equivalent to the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose equivalent data properties are to be retrieved.

Returns

All data properties *e* where the root ontology imports closure entails `EquivalentDataProperties(dp e)`. If *dp* is unsatisfiable with respect to the set of reasoner axioms then `owl:bottomDataProperty` will be returned.

disjoint_object_properties (*op*: `owlapy.owl_property.OWLObjectPropertyExpression`)
→ `Iterable[owlapy.owl_property.OWLObjectPropertyExpression]`

Gets the simplified object properties that are disjoint with the specified object property with respect to the set of reasoner axioms.

Parameters

op – The object property whose disjoint object properties are to be retrieved.

Returns

All simplified object properties *e* where the root ontology imports closure entails `EquivalentObjectProperties(e ObjectPropertyComplementOf(op))` or `StrictSubObjectPropertyOf(e ObjectPropertyComplementOf(op))`.

disjoint_data_properties (*dp*: `owlapy.owl_property.OWLDataProperty`)
→ `Iterable[owlapy.owl_property.OWLDataProperty]`

Gets the data properties that are disjoint with the specified data property with respect to the set of reasoner axioms.

Parameters

dp – The data property whose disjoint data properties are to be retrieved.

Returns

All data properties *e* where the root ontology imports closure entails `EquivalentDataProperties(e DataPropertyComplementOf(dp))` or `StrictSubDataPropertyOf(e DataPropertyComplementOf(dp))`.

super_data_properties (*dp*: `owlapy.owl_property.OWLDataProperty`, *direct*: `bool = False`)
→ `Iterable[owlapy.owl_property.OWLDataProperty]`

Gets the stream of data properties that are the strict (potentially direct) super properties of the specified data property with respect to the imports closure of the root ontology.

Parameters

- **dp** (`OWLDataProperty`) – The data property whose super properties are to be retrieved.
- **direct** (`bool`) – Specifies if the direct super properties should be retrieved (`True`) or if the all super properties (ancestors) should be retrieved (`False`).

Returns

Iterable of super properties.

sub_data_properties (*dp*: *owlapy.owl_property.OWLDataProperty*, *direct*: *bool = False*)
→ *Iterable[owlapy.owl_property.OWLDataProperty]*

Gets the set of named data properties that are the strict (potentially direct) subproperties of the specified data property expression with respect to the imports closure of the root ontology.

Parameters

- **dp** – The data property whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If *direct* is True, each property *P* where the set of reasoner axioms entails *DirectSubDataPropertyOf(P, pe)*. If *direct* is False, each property *P* where the set of reasoner axioms entails *StrictSubDataPropertyOf(P, pe)*. If *pe* is equivalent to *owl:bottomDataProperty* then nothing will be returned.

super_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*,
direct: *bool = False*) → *Iterable[owlapy.owl_property.OWLObjectPropertyExpression]*

Gets the stream of object properties that are the strict (potentially direct) super properties of the specified object property with respect to the imports closure of the root ontology.

Parameters

- **op** (*OWLObjectPropertyExpression*) – The object property expression whose super properties are to be retrieved.
- **direct** (*bool*) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

sub_object_properties (*op*: *owlapy.owl_property.OWLObjectPropertyExpression*, *direct*: *bool = False*)
→ *Iterable[owlapy.owl_property.OWLObjectPropertyExpression]*

Gets the stream of simplified object property expressions that are the strict (potentially direct) subproperties of the specified object property expression with respect to the imports closure of the root ontology.

Parameters

- **op** – The object property expression whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If *direct* is True, simplified object property expressions, such that for each simplified object property expression, *P*, the set of reasoner axioms entails *DirectSubObjectPropertyOf(P, pe)*. If *direct* is False, simplified object property expressions, such that for each simplified object property expression, *P*, the set of reasoner axioms entails *StrictSubObjectPropertyOf(P, pe)*. If *pe* is equivalent to *owl:bottomObjectProperty* then nothing will be returned.

types (*ind*: *owlapy.owl_individual.OWLNamedIndividual*, *direct*: *bool = False*)
→ *Iterable[owlapy.class_expression.OWLClass]*

Gets the named classes which are (potentially direct) types of the specified named individual.

Parameters

- **ind** – The individual whose types are to be retrieved.

- **direct** – Specifies if the direct types should be retrieved (True), or if all types should be retrieved (False).

Returns

If **direct** is True, each named class C where the set of reasoner axioms entails `DirectClassAssertion(C, ind)`. If **direct** is False, each named class C where the set of reasoner axioms entails `ClassAssertion(C, ind)`.

get_root_ontology () → *owlapy.abstracts.abstract_owl_ontology.AbstractOWL ontology*

Gets the “root” ontology that is loaded into this reasoner. The reasoner takes into account the axioms in this ontology and its import’s closure.

get_instances_from_owl_class (c: *owlapy.class_expression.OWLClass*)

reset_and_disable_cache ()

class owlapy.owl_reasoner.SyncReasoner (ontology: *owlapy.owl_ontology.SyncOntology* | str, reasoner=*‘Hermit’*)

Bases: *owlapy.abstracts.abstract_owl_reasoner.AbstractOWLReasoner*

An OWLReasoner reasons over a set of axioms (the set of reasoner axioms) that is based on the imports closure of a particular ontology - the “root” ontology.

mapper

inference_types_mapping

instances (ce: *owlapy.class_expression.OWLClassExpression*, direct: bool = False, timeout: int = 1000)

Gets the individuals which are instances of the specified class expression.

Parameters

- **ce** – The class expression whose instances are to be retrieved.
- **direct** – Specifies if the direct instances should be retrieved (True), or if all instances should be retrieved (False).
- **timeout** – Time limit in seconds until results must be returned, else empty set is returned.

Returns

If **direct** is True, each named individual j where the set of reasoner axioms entails `DirectClassAssertion(ce, j)`. If **direct** is False, each named individual j where the set of reasoner axioms entails `ClassAssertion(ce, j)`. If ce is unsatisfiable with respect to the set of reasoner axioms then nothing returned.

equivalent_classes (ce: *owlapy.class_expression.OWLClassExpression*)
→ List[*owlapy.class_expression.OWLClassExpression*]

Gets the set of named classes that are equivalent to the specified class expression with respect to the set of reasoner axioms.

Parameters

ce (*OWLClassExpression*) – The class expression whose equivalent classes are to be retrieved.

Returns

Equivalent classes of the given class expression.

disjoint_classes (ce: *owlapy.class_expression.OWLClassExpression*)
→ List[*owlapy.class_expression.OWLClassExpression*]

Gets the classes that are disjoint with the specified class expression.

Parameters

ce (*OWLClassExpression*) – The class expression whose disjoint classes are to be retrieved.

Returns

Disjoint classes of the given class expression.

sub_classes (*ce: owlapy.class_expression.OWLClassExpression, direct=False*)
→ List[*owlapy.class_expression.OWLClassExpression*]

Gets the set of named classes that are the strict (potentially direct) subclasses of the specified class expression with respect to the reasoner axioms.

Args:

ce (*OWLClassExpression*): The class expression whose strict (direct) subclasses are to be retrieved. **direct** (*bool, optional*): Specifies if the direct subclasses should be retrieved (*True*) or if

all subclasses (descendant) classes should be retrieved (*False*). Defaults to *False*.

Returns

The subclasses of the given class expression depending on *direct* field.

super_classes (*ce: owlapy.class_expression.OWLClassExpression, direct=False*)
→ List[*owlapy.class_expression.OWLClassExpression*]

Gets the stream of named classes that are the strict (potentially direct) super classes of the specified class expression with respect to the imports closure of the root ontology.

Parameters

- **ce** (*OWLClassExpression*) – The class expression whose strict (direct) subclasses are to be retrieved.
- **direct** (*bool, optional*) – Specifies if the direct superclasses should be retrieved (*True*) or if all superclasses (descendant) classes should be retrieved (*False*). Defaults to *False*.

Returns

The subclasses of the given class expression depending on *direct* field.

data_property_domains (*p: owlapy.owl_property.OWLDataProperty, direct: bool = False*)

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **p** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (*True*), or if all domains should be retrieved (*False*).

Returns

Let *N* = *equivalent_classes(DataSomeValuesFrom(pe rdfs:Literal))*. If *direct* is *True*: then if *N* is not empty then the return value is *N*, else the return value is the result of *super_classes(DataSomeValuesFrom(pe rdfs:Literal), true)*. If *direct* is *False*: then the result of *super_classes(DataSomeValuesFrom(pe rdfs:Literal), false)* together with *N* if *N* is non-empty. (Note, *rdfs:Literal* is the top datatype).

object_property_domains (*p: owlapy.owl_property.OWLObjectProperty, direct: bool = False*)

Gets the class expressions that are the direct or indirect domains of this property with respect to the imports closure of the root ontology.

Parameters

- **p** – The property expression whose domains are to be retrieved.
- **direct** – Specifies if the direct domains should be retrieved (True), or if all domains should be retrieved (False).

Returns

Let $N = \text{equivalent_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}))$. If **direct** is True: then if N is not empty then the return value is N , else the return value is the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}), \text{true})$. If **direct** is False: then the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{pe owl:Thing}), \text{false})$ together with N if N is non-empty.

object_property_ranges (*p: owlapy.owl_property.OWLObjectProperty, direct: bool = False*)

Gets the class expressions that are the direct or indirect ranges of this property with respect to the imports closure of the root ontology.

Parameters

- **p** – The property expression whose ranges are to be retrieved.
- **direct** – Specifies if the direct ranges should be retrieved (True), or if all ranges should be retrieved (False).

Returns

Let $N = \text{equivalent_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})))$. If **direct** is True: then if N is not empty then the return value is N , else the return value is the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})), \text{true})$. If **direct** is False: then the result of $\text{super_classes}(\text{ObjectSomeValuesFrom}(\text{ObjectInverseOf}(\text{pe owl:Thing})), \text{false})$ together with N if N is non-empty.

sub_object_properties (*p: owlapy.owl_property.OWLObjectProperty, direct: bool = False*)

Gets the stream of simplified object property expressions that are the strict (potentially direct) subproperties of the specified object property expression with respect to the imports closure of the root ontology.

Parameters

- **p** – The object property expression whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If **direct** is True, simplified object property expressions, such that for each simplified object property expression, P , the set of reasoner axioms entails $\text{DirectSubObjectPropertyOf}(P, \text{pe})$. If **direct** is False, simplified object property expressions, such that for each simplified object property expression, P , the set of reasoner axioms entails $\text{StrictSubObjectPropertyOf}(P, \text{pe})$. If pe is equivalent to $\text{owl:bottomObjectProperty}$ then nothing will be returned.

super_object_properties (*p: owlapy.owl_property.OWLObjectProperty, direct: bool = False*)

Gets the stream of object properties that are the strict (potentially direct) super properties of the specified object property with respect to the imports closure of the root ontology.

Parameters

- **p** (*OWLObjectPropertyExpression*) – The object property expression whose super properties are to be retrieved.

- **direct** (*bool*) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

sub_data_properties (*p: owlapy.owl_property.OWLDataProperty, direct: bool = False*)

Gets the set of named data properties that are the strict (potentially direct) subproperties of the specified data property expression with respect to the imports closure of the root ontology.

Parameters

- **p** – The data property whose strict (direct) subproperties are to be retrieved.
- **direct** – Specifies if the direct subproperties should be retrieved (True) or if the all subproperties (descendants) should be retrieved (False).

Returns

If direct is True, each property P where the set of reasoner axioms entails DirectSubDataPropertyOf(P, pe). If direct is False, each property P where the set of reasoner axioms entails StrictSubDataPropertyOf(P, pe). If pe is equivalent to owl:bottomDataProperty then nothing will be returned.

super_data_properties (*p: owlapy.owl_property.OWLDataProperty, direct: bool = False*)

Gets the stream of data properties that are the strict (potentially direct) super properties of the specified data property with respect to the imports closure of the root ontology.

Parameters

- **p** (*OWLDataProperty*) – The data property whose super properties are to be retrieved.
- **direct** (*bool*) – Specifies if the direct super properties should be retrieved (True) or if the all super properties (ancestors) should be retrieved (False).

Returns

Iterable of super properties.

different_individuals (*i: owlapy.owl_individual.OWLNamedIndividual*)

Gets the individuals that are different from the specified individual with respect to the set of reasoner axioms.

Parameters

i – The individual whose different individuals are to be retrieved.

Returns

All individuals x where the set of reasoner axioms entails DifferentIndividuals(ind x).

same_individuals (*i: owlapy.owl_individual.OWLNamedIndividual*)

Gets the individuals that are the same as the specified individual with respect to the set of reasoner axioms.

Parameters

i – The individual whose same individuals are to be retrieved.

Returns

All individuals x where the root ontology imports closure entails SameIndividual(ind x).

equivalent_object_properties (*p: owlapy.owl_property.OWLObjectProperty*)

Gets the simplified object properties that are equivalent to the specified object property with respect to the set of reasoner axioms.

Parameters

p – The object property whose equivalent object properties are to be retrieved.

Returns

All simplified object properties e where the root ontology imports closure entails $\text{EquivalentObjectProperties}(\text{op } e)$. If op is unsatisfiable with respect to the set of reasoner axioms then $\text{owl:bottomDataProperty}$ will be returned.

equivalent_data_properties (p : *owlapy.owl_property.OWLDataProperty*)

Gets the data properties that are equivalent to the specified data property with respect to the set of reasoner axioms.

Parameters

p – The data property whose equivalent data properties are to be retrieved.

Returns

All data properties e where the root ontology imports closure entails $\text{EquivalentDataProperties}(\text{dp } e)$. If dp is unsatisfiable with respect to the set of reasoner axioms then $\text{owl:bottomDataProperty}$ will be returned.

object_property_values (i : *owlapy.owl_individual.OWLNamedIndividual*,
 p : *owlapy.owl_property.OWLObjectProperty*)

Gets the object property values for the specified individual and object property expression.

Parameters

- i – The individual that is the subject of the object property values.
- p – The object property expression whose values are to be retrieved for the specified individual.

Returns

The named individuals such that for each individual j , the set of reasoner axioms entails $\text{ObjectPropertyAssertion}(pe \text{ ind } j)$.

data_property_values (e : *owlapy.owl_object.OWLEntity*, p : *owlapy.owl_property.OWLDataProperty*)

Gets the data property values for the specified entity and data property expression.

Parameters

- e – The entity (usually an individual) that is the subject of the data property values.
- p – The data property expression whose values are to be retrieved for the specified individual.

Returns

A set of OWLLiterals containing literals such that for each literal l in the set, the set of reasoner axioms entails $\text{DataPropertyAssertion}(pe \text{ ind } l)$.

disjoint_object_properties (p : *owlapy.owl_property.OWLObjectProperty*)

Gets the simplified object properties that are disjoint with the specified object property with respect to the set of reasoner axioms.

Parameters

p – The object property whose disjoint object properties are to be retrieved.

Returns

All simplified object properties e where the root ontology imports closure entails $\text{EquivalentObjectProperties}(e \text{ ObjectPropertyComplementOf}(\text{op}))$ or $\text{StrictSubObjectPropertyOf}(e \text{ ObjectPropertyComplementOf}(\text{op}))$.

disjoint_data_properties (p : *owlapy.owl_property.OWLDataProperty*)

Gets the data properties that are disjoint with the specified data property with respect to the set of reasoner axioms.

Parameters

p – The data property whose disjoint data properties are to be retrieved.

Returns

All data properties *e* where the root ontology imports closure entails `EquivalentDataProperties(e DataPropertyComplementOf(dp))` or `StrictSubDataPropertyOf(e DataPropertyComplementOf(dp))`.

types (*individual*: *owlapy.owl_individual.OWLNamedIndividual*, *direct*: *bool = False*)

Gets the named classes which are (potentially direct) types of the specified named individual.

Parameters

- **individual** – The individual whose types are to be retrieved.
- **direct** – Specifies if the direct types should be retrieved (True), or if all types should be retrieved (False).

Returns

If *direct* is True, each named class *C* where the set of reasoner axioms entails `DirectClassAssertion(C, ind)`. If *direct* is False, each named class *C* where the set of reasoner axioms entails `ClassAssertion(C, ind)`.

has_consistent_ontology () → bool

Check if the used ontology is consistent.

Returns

True if the ontology used by this reasoner is consistent, False otherwise.

Return type

bool

infer_axioms (*inference_types*: *list[str]*) → *Iterable[owlapy.owl_axiom.OWLAxiom]*

Infer the specified inference type of axioms for the ontology managed by this instance's reasoner and return them.

Parameters

inference_types – Axiom inference types: Available options (can set more than 1): [`"InferredClassAssertionAxiomGenerator"`, `"InferredSubClassAxiomGenerator"`, `"InferredDisjointClassesAxiomGenerator"`, `"InferredEquivalentClassAxiomGenerator"`, `"InferredEquivalentDataPropertiesAxiomGenerator"`, `"InferredEquivalentObjectPropertyAxiomGenerator"`, `"InferredInverseObjectPropertiesAxiomGenerator"`, `"InferredSubDataPropertyAxiomGenerator"`, `"InferredSubObjectPropertyAxiomGenerator"`, `"InferredDataPropertyCharacteristicAxiomGenerator"`, `"InferredObjectPropertyCharacteristicAxiomGenerator"`]

Returns

Iterable of inferred axioms.

infer_axioms_and_save (*output_path*: *str = None*, *output_format*: *str = None*, *inference_types*: *list[str] = None*)

Generates inferred axioms for the ontology managed by this instance's reasoner and saves them to a file. This function uses the OWL API to generate inferred class assertion axioms based on the ontology and reasoner associated with this instance. The inferred axioms are saved to the specified output file in the desired format.

Parameters

- **output_path** – The name of the file where the inferred axioms will be saved.

- **output_format** – The format in which to save the inferred axioms. Supported formats are: - “ttl” or “turtle” for Turtle format - “rdf/xml” for RDF/XML format - “owl/xml” for OWL/XML format If not specified, the format of the original ontology is used.
- **inference_types** – Axiom inference types: Available options (can set more than 1): [“InferredClassAssertionAxiomGenerator”, “InferredSubClassAxiomGenerator”, “InferredDisjointClassesAxiomGenerator”, “InferredEquivalentClassAxiomGenerator”, “InferredEquivalentDataPropertiesAxiomGenerator”, “InferredEquivalentObjectPropertyAxiomGenerator”, “InferredInverseObjectPropertiesAxiomGenerator”, “InferredSubDataPropertyAxiomGenerator”, “InferredSubObjectPropertyAxiomGenerator”, “InferredDataPropertyCharacteristicAxiomGenerator”, “InferredObjectPropertyCharacteristicAxiomGenerator”]

Returns

None (the file is saved to the specified directory)

generate_and_save_inferred_class_assertion_axioms (*output='temp.ttl', output_format: str = None*)

Generates inferred class assertion axioms for the ontology managed by this instance’s reasoner and saves them to a file. This function uses the OWL API to generate inferred class assertion axioms based on the ontology and reasoner associated with this instance. The inferred axioms are saved to the specified output file in the desired format. Parameters: ——— output : str, optional

The name of the file where the inferred axioms will be saved. Default is “temp.ttl”.

output_format

[str, optional] The format in which to save the inferred axioms. Supported formats are: - “ttl” or “turtle” for Turtle format - “rdf/xml” for RDF/XML format - “owl/xml” for OWL/XML format If not specified, the format of the original ontology is used.

Notes:

- The function supports saving in multiple formats: Turtle, RDF/XML, and OWL/XML.
- The inferred axioms are generated using the reasoner associated with this instance and the OWL API’s InferredClassAssertionAxiomGenerator.
- The inferred axioms are added to a new ontology which is then saved in the specified format.

Example:

```
>>> instance.generate_and_save_inferred_class_assertion_axioms(output=
↳ "inferred_axioms.ttl", format="ttl")
This will save the inferred class assertion axioms to the file "inferred_
↳ axioms.ttl" in Turtle format.
```

is_entailed (*axiom: owlapi.owl_axiom.OWLXiom*) → bool

A convenience method that determines if the specified axiom is entailed by the set of reasoner axioms.

Parameters

axiom – The axiom to check for entailment.

Returns

True if the axiom is entailed by the reasoner axioms and False otherwise.

is_satisfiable (*ce: owlapi.class_expression.OWLClassExpression*) → bool

A convenience method that determines if the specified class expression is satisfiable with respect to the reasoner axioms.

Parameters

ce – The class expression to check for satisfiability.

Returns

True if the class expression is satisfiable by the reasoner axioms and False otherwise.

unsatisfiable_classes()

A convenience method that obtains the classes in the signature of the root ontology that are unsatisfiable.

get_root_ontology() → *owlapy.abstracts.abstract_owl_ontology.AbstractOWLontology*

Gets the “root” ontology that is loaded into this reasoner. The reasoner takes into account the axioms in this ontology and its import’s closure.

`owlapy.owl_reasoner.initialize_reasoner(reasoner: str, owlapi_ontology)`

`owlapy.owl_reasoner.import_and_include_axioms_generators()`

owlapy.owlapi_mapper

Classes

OWLAPIMapper

A bridge between owlapy and owlapi owl-related classes.

Functions

init(the_class)

Since classes names in owlapi and owlapy are pretty much similar with the small difference that in owlapi they

Module Contents

`owlapy.owlapi_mapper.init(the_class)`

Since classes names in owlapi and owlapy are pretty much similar with the small difference that in owlapi they usually have the ‘Impl’ part then we can create the mapping class name dynamically reducing the amount of code significantly. That’s what this method does.

class `owlapy.owlapi_mapper.OWLAPIMapper`

A bridge between owlapy and owlapi owl-related classes.

map_(*e*)

(owlapy <=> owlapi) entity mapping.

Parameters

e – OWL entity/expression.

static to_list(*stream_obj*)

Converts Java Stream object to Python list

owlapy.parser

String to OWL parsers.

Attributes

<i>MANCHESTER_GRAMMAR</i>
<i>DL_GRAMMAR</i>
<i>DLparser</i>
<i>ManchesterParser</i>

Classes

<i>ManchesterOWLSyntaxParser</i>	Manchester Syntax parser to parse strings to OWLClassExpressions.
<i>DLSyntaxParser</i>	Description Logic Syntax parser to parse strings to OWLClassExpressions.

Functions

<i>dl_to_owl_expression</i> (dl_expression, namespace)
<i>manchester_to_owl_expression</i> (manchester_express...)

Module Contents

owlapy.parser.**MANCHESTER_GRAMMAR**

```
class owlapy.parser.ManchesterOWLSyntaxParser(  
    namespace: str | owlapy.namespaces.Namespaces | None = None, grammar=None)
```

Bases: parsimonious.nodes.NodeVisitor, owlapy.owl_object.OWLObjectParser

Manchester Syntax parser to parse strings to OWLClassExpressions. Following: <https://www.w3.org/TR/owl2-manchester-syntax>.

```
slots = ('ns', 'grammar')
```

```
ns: str | owlapy.namespaces.Namespaces | None
```

```
grammar = None
```

```
parse_expression(expression_str: str) → owlapy.class_expression.OWLClassExpression
```

Parse a string to an OWL Object.

Parameters

expression_str (*str*) – Expression string.

Returns

The OWL Object which is represented by the string.

```
visit_union(node, children) → owlapy.class_expression.OWLClassExpression
```

visit_intersection (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*
visit_primary (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*
visit_some_only_res (*node*, *children*) → *owlapy.class_expression.OWLQuantifiedObjectRestriction*
visit_cardinality_res (*node*, *children*) → *owlapy.class_expression.OWLObjectCardinalityRestriction*
visit_value_res (*node*, *children*) → *owlapy.class_expression.OWLObjectHasValue*
visit_has_self (*node*, *children*) → *owlapy.class_expression.OWLObjectHasSelf*
visit_object_property (*node*, *children*) → *owlapy.owl_property.OWLObjectPropertyExpression*
visit_class_expression (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*
visit_individual_list (*node*, *children*) → *owlapy.class_expression.OWLObjectOneOf*
visit_data_primary (*node*, *children*) → *owlapy.owl_data_ranges.OWLDataRange*
visit_data_some_only_res (*node*, *children*)
 → *owlapy.class_expression.OWLQuantifiedDataRestriction*
visit_data_cardinality_res (*node*, *children*)
 → *owlapy.class_expression.OWLDataCardinalityRestriction*

visit_float_literal (*node*, *children*) → *owlapy.owl_literal.OWLLiteral*
visit_decimal_literal (*node*, *children*) → *owlapy.owl_literal.OWLLiteral*
visit_integer_literal (*node*, *children*) → *owlapy.owl_literal.OWLLiteral*
visit_boolean_literal (*node*, *children*) → *owlapy.owl_literal.OWLLiteral*
visit_datetime_literal (*node*, *children*) → *owlapy.owl_literal.OWLLiteral*

```

visit_duration_literal (node, children) → owlapy.owl_literal.OWLLiteral
visit_date_literal (node, children) → owlapy.owl_literal.OWLLiteral
visit_non_negative_integer (node, children) → int
visit_datatype_iri (node, children) → str
visit_datatype (node, children) → owlapy.owl_datatype.OWLDatatype
visit_facet (node, children) → owlapy.vocab.OWLFacet
visit_class_iri (node, children) → owlapy.class_expression.OWLClass
visit_individual_iri (node, children) → owlapy.owl_individual.OWLNamedIndividual
visit_object_property_iri (node, children) → owlapy.owl_property.OWLObjectProperty
visit_data_property_iri (node, children) → owlapy.owl_property.OWLDataProperty
visit_iri (node, children) → owlapy.iri.IRI
visit_full_iri (node, children) → owlapy.iri.IRI
abstract visit_abbreviated_iri (node, children)
visit_simple_iri (node, children) → owlapy.iri.IRI
visit_parentheses (node, children) → owlapy.class_expression.OWLClassExpression
generic_visit (node, children)

```

Default visitor method

Parameters

- **node** – The node we’re visiting
- **visited_children** – The results of visiting the children of that node, in a list

I’m not sure there’s an implementation of this that makes sense across all (or even most) use cases, so we leave it to subclasses to implement for now.

```
owlapy.parser.DL_GRAMMAR
```

```
class owlapy.parser.DLSyntaxParser (namespace: str | owlapy.namespaces.Namespaces | None = None,
                                     grammar=None)
```

Bases: parsimonious.nodes.NodeVisitor, owlapy.owl_object.OWLObjectParser

Description Logic Syntax parser to parse strings to OWLClassExpressions.

```
slots = ('ns', 'grammar')
```

```
ns: str | owlapy.namespaces.Namespaces | None
```

```
grammar = None
```

```
parse_expression (expression_str: str) → owlapy.class_expression.OWLClassExpression
```

Parse a string to an OWL Object.

Parameters

expression_str (*str*) – Expression string.

Returns

The OWL Object which is represented by the string.

visit_union (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*

visit_intersection (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*

visit_primary (*node*, *children*) → *owlapy.class_expression.OWLClassExpression*

visit_some_only_res (*node*, *children*) → *owlapy.class_expression.OWLQuantifiedObjectRestriction*

visit_cardinality_res (*node*, *children*) → *owlapy.class_expression.OWLObjectCardinalityRestriction*

visit_value_res (*node*, *children*) → *owlapy.class_expression.OWLObjectHasValue*

visit_has_self (*node*, *children*) → *owlapy.class_expression.OWLObjectHasSelf*

visit_simple_iri (node, children) → owlapy.iri.IRI
visit_parentheses (node, children) → owlapy.class_expression.OWLClassExpression
generic_visit (node, children)

```

Default visitor method

Parameters

- **node** – The node we’re visiting
- **visited_children** – The results of visiting the children of that node, in a list

I’m not sure there’s an implementation of this that makes sense across all (or even most) use cases, so we leave it to subclasses to implement for now.

```
owlapy.parser.DLparser

```

```
owlapy.parser.dl_to_owl_expression (dl_expression: str, namespace: str)
```

```
owlapy.parser.manchester_to_owl_expression (manchester_expression: str, namespace: str)
```

owlapy.providers

OWL Datatype restriction constructors.

Attributes

Restriction_Literals

Functions

<code>owl_datatype_max_exclusive_restriction(...)</code>	Create a max exclusive restriction.
<code>owl_datatype_min_exclusive_restriction(...)</code>	Create a min exclusive restriction.
<code>owl_datatype_max_inclusive_restriction(...)</code>	Create a max inclusive restriction.
<code>owl_datatype_min_inclusive_restriction(...)</code>	Create a min inclusive restriction.
<code>owl_datatype_min_max_exclusive_restriction(...)</code>	Create a min-max exclusive restriction.
<code>owl_datatype_min_max_inclusive_restriction(...)</code>	Create a min-max inclusive restriction.

Module Contents

`owlapy.providers.Restriction_Literals`

`owlapy.providers.owl_datatype_max_exclusive_restriction(max_: Restriction_Literals)`
→ `owlapy.class_expression.OWLDatatypeRestriction`

Create a max exclusive restriction.

`owlapy.providers.owl_datatype_min_exclusive_restriction(min_: Restriction_Literals)`
→ `owlapy.class_expression.OWLDatatypeRestriction`

Create a min exclusive restriction.

`owlapy.providers.owl_datatype_max_inclusive_restriction(max_: Restriction_Literals)`
→ `owlapy.class_expression.OWLDatatypeRestriction`

Create a max inclusive restriction.

`owlapy.providers.owl_datatype_min_inclusive_restriction(min_: Restriction_Literals)`
→ `owlapy.class_expression.OWLDatatypeRestriction`

Create a min inclusive restriction.

`owlapy.providers.owl_datatype_min_max_exclusive_restriction(min_: Restriction_Literals, max_: Restriction_Literals)` → `owlapy.class_expression.OWLDatatypeRestriction`

Create a min-max exclusive restriction.

`owlapy.providers.owl_datatype_min_max_inclusive_restriction(min_: Restriction_Literals, max_: Restriction_Literals)` → `owlapy.class_expression.OWLDatatypeRestriction`

Create a min-max inclusive restriction.

`owlapy.render`

Renderers for different syntax.

Attributes

<code>mapper</code>
<code>DLrenderer</code>
<code>ManchesterRenderer</code>

Classes

<code>DLSyntaxObjectRenderer</code>	DL Syntax renderer for OWL Objects.
<code>ManchesterOWLSyntaxOWLObjectRenderer</code>	Manchester Syntax renderer for OWL Objects

Functions

<code>translating_short_form_provider(→ str)</code>	<code>e</code> : entity.
<code>translating_short_form_endpoint(→ str)</code>	Translates an OWLEntity to a short form string using provided rules and an endpoint.
<code>owl_expression_to_dl(→ str)</code>	
<code>owl_expression_to_manchester(→ str)</code>	

Module Contents

`owlapy.render.mapper`

`owlapy.render.translating_short_form_provider` (*e*: `owlapy.owl_object.OWLEntity`, *reasoner*,
rules: `dict[str:str] = None`) → str

e: entity. *reasoner*: OWLReasoner or Triplestore(from Ontolearn) *rules*: A mapping from OWLEntity to predicates,

Keys in rules can be general or specific iris, e.g., IRI to IRI s.t. the second IRI must be a predicate leading to literal

`owlapy.render.translating_short_form_endpoint` (*e*: `owlapy.owl_object.OWLEntity`, *endpoint*: str,
rules: `dict[abc.ABCMeta:str] = None`) → str

Translates an OWLEntity to a short form string using provided rules and an endpoint.

Parameters: *e* (OWLEntity): The OWL entity to be translated. *endpoint* (str): The endpoint of a triple store to query against. *rules* (`dict[abc.ABCMeta:str]`, optional): A dictionary mapping OWL classes to string IRIs leading to a literal.

Returns: str: The translated short form of the OWL entity. If no matching rules are found, a simple short form is returned.

This function iterates over the provided rules to check if the given OWL entity is an instance of any specified class. If a match is found, it constructs a SPARQL query to retrieve the literal value associated with the entity and predicate. If a literal is found, it is returned as the short form. If no literals are found, the SPARQL query and entity information are printed for debugging purposes. If no matching rules are found, a warning is issued and a simple short form is returned.

Example: >>> e = OWLEntity("http://example.org/entity") >>> endpoint = "http://example.org/sparql" >>> rules = {SomeOWLClass: "http://example.org/predicate"} >>> translating_short_form_endpoint(e, endpoint, rules)

```
class owlapy.render.DLSyntaxObjectRenderer (
    short_form_provider: Callable[[owlapy.owl_object.OWLEntity], str] = _simple_short_form_provider)
```

Bases: *owlapy.owl_object.OWLObjectRenderer*

DL Syntax renderer for OWL Objects.

__slots__ = '_sfp'

set_short_form_provider (*short_form_provider: Callable[[owlapy.owl_object.OWLEntity], str]*)
→ None

Configure a short form provider that shortens the OWL objects during rendering.

Parameters

short_form_provider – Short form provider.

render (*o: owlapy.owl_object.OWLObject*) → str

Render OWL Object to string.

Parameters

o – OWL Object.

Returns

String rendition of OWL object.

```
class owlapy.render.ManchesterOWLSyntaxOWLObjectRenderer (
    short_form_provider: Callable[[owlapy.owl_object.OWLEntity], str] = _simple_short_form_provider,
    no_render_thing=False)
```

Bases: *owlapy.owl_object.OWLObjectRenderer*

Manchester Syntax renderer for OWL Objects

__slots__ = ('_sfp', '_no_render_thing')

set_short_form_provider (*short_form_provider: Callable[[owlapy.owl_object.OWLEntity], str]*)
→ None

Configure a short form provider that shortens the OWL objects during rendering.

Parameters

short_form_provider – Short form provider.

render (*o: owlapy.owl_object.OWLObject*) → str

Render OWL Object to string.

Parameters

o – OWL Object.

Returns

String rendition of OWL object.

owlapy.render.DLrenderer

owlapy.render.ManchesterRenderer

owlapy.render.owl_expression_to_dl (*o: owlapy.owl_object.OWLObject*) → str

owlapy.render.owl_expression_to_manchester (*o: owlapy.owl_object.OWLObject*) → str

owlapy.static_funcs

Static functions for general purposes.

Functions

<code>move(*args)</code>	"Move" an imported class to the current module by setting the classes <code>__module__</code> attribute.
<code>download_external_files(ftp_link)</code>	
<code>startJVM()</code>	Start the JVM with jar dependencies. This method is called automatically on object initialization, if the
<code>stopJVM(→ None)</code>	Detaches the thread from Java packages and shuts down the java virtual machine hosted by jpyype.
<code>create_ontology(iri[, with_owlapi])</code>	A convenient function

Module Contents

`owlapy.static_funcs.move(*args)`

“Move” an imported class to the current module by setting the classes `__module__` attribute.

This is useful for documentation purposes to hide internal packages in sphinx.

Parameters

args – List of classes to move.

`owlapy.static_funcs.download_external_files(ftp_link: str)`

`owlapy.static_funcs.startJVM()`

Start the JVM with jar dependencies. This method is called automatically on object initialization, if the JVM is not started yet.

`owlapy.static_funcs.stopJVM() → None`

Detaches the thread from Java packages and shuts down the java virtual machine hosted by jpyype.

`owlapy.static_funcs.create_ontology(iri, with_owlapi=False)`

A convenient function

owlapy.util_owl_static_funcs

Functions

<code>save_owl_class_expressions(→ None)</code>	Saves a set of OWL class expressions to an ontology file in RDF/XML format.
<code>csv_to_rdf_kg([path_csv, path_kg, namespace])</code>	Transforms a CSV file to an RDF Knowledge Graph in RDF/XML format.

Module Contents

`owlapy.util_owl_static_funcs.save_owl_class_expressions(`
 `expressions: owlapy.class_expression.OWLClassExpression | List[owlapy.class_expression.OWLClassExpression],`
 `path: str = 'predictions', rdf_format: str = 'rdfxml', namespace: str = None) → None`

Saves a set of OWL class expressions to an ontology file in RDF/XML format.

This function takes one or more OWL class expressions, creates an ontology, and saves the expressions as OWL equivalent class axioms in the specified RDF format. By default, it saves the file to the specified path using the 'rdxml' format.

Parameters

- **expressions** (`OWLClassExpression` / `List[OWLClassExpression]`) – A single or a list of OWL class expressions to be saved as equivalent class axioms.
- **path** (`str`, *optional*) – The file path where the ontology will be saved. Defaults to 'predictions'.
- **rdxml_format** (`str`, *optional*) – RDF serialization format for saving the ontology. Currently only supports 'rdxml'. Defaults to 'rdxml'.
- **namespace** (`str`, *optional*) – The namespace URI used for the ontology. If None, defaults to '<https://dice-research.org/predictions#>'. Must end with '#'.

Raises

- **AssertionError** – If *expressions* is neither an `OWLClassExpression` nor a list of `OWLClassExpression`.
- **AssertionError** – If *rdxml_format* is not 'rdxml'.
- **AssertionError** – If *namespace* does not end with a '#'.

Example

```
>>> from some_module import OWLClassExpression
>>> expr1 = OWLClassExpression("SomeExpression1")
>>> expr2 = OWLClassExpression("SomeExpression2")
>>> save_owl_class_expressions([expr1, expr2], path="my_ontology.owl", rdxml_format=
↳ "rdxml")
```

`owlapy.util_owl_static_funcs.csv_to_rdf_kg(path_csv: str = None, path_kg: str = None, namespace: str = None)`

Transforms a CSV file to an RDF Knowledge Graph in RDF/XML format.

Parameters

- **path_csv** (`str`) – X
- **path_kg** (`str`) – X
- **namespace** (`str`) – X

Raises

AssertionError –

Example

```
>>> from sklearn.datasets import load_iris
>>> import pandas as pd
# Load the dataset
>>> data = load_iris()
# Convert to DataFrame
>>> df = pd.DataFrame(data.data, columns=data.feature_names)
>>> df['target'] = data.target
# Save as CSV
```

(continues on next page)

(continued from previous page)

```
>>> df.to_csv("iris_dataset.csv", index=False)
>>> print("Dataset saved as iris_dataset.csv")
>>> csv_to_rdf_kg("iris_dataset.csv")
```

owlapy.utils

Owlapy utils.

Attributes

measurer

Classes

<i>OWLClassExpressionLengthMetric</i>	Length calculation of OWLClassExpression
<i>EvaluatedDescriptionSet</i>	Abstract base class for generic types.
<i>ConceptOperandSorter</i>	
<i>OperandSetTransform</i>	
<i>HasIndex</i>	Interface for types with an index; this is used to group objects by type when sorting.
<i>OrderedOWLObject</i>	Holder of OWL Objects that can be used for Python sorted.
<i>NNF</i>	This class contains functions to transform a Class Expression into Negation Normal Form.
<i>TopLevelCNF</i>	This class contains functions to transform a class expression into Top-Level Conjunctive Normal Form.
<i>TopLevelDNF</i>	This class contains functions to transform a class expression into Top-Level Disjunctive Normal Form.
<i>LRUCache</i>	Constants shares by all lru cache instances.

Functions

<i>run_with_timeout(func, timeout[, args])</i>	
<i>concept_reducer(concepts, opt)</i>	Reduces a set of concepts by applying a binary operation to each pair of concepts.
<i>concept_reducer_properties(...)</i>	Map a set of owl concepts and a set of properties into OWL Restrictions
<i>get_expression_length(→ int)</i>	
<i>combine_nary_expressions(...)</i>	Shortens an OWLClassExpression or OWLDataRange by combining all nested nary expressions of the same type.
<i>iter_count(→ int)</i>	Count the number of elements in an iterable.
<i>as_index(→ HasIndex)</i>	Cast OWL Object to HasIndex.

Module Contents

`owlapy.utils.run_with_timeout` (*func*, *timeout*, *args=()*, ***kwargs*)

`owlapy.utils.concept_reducer` (*concepts: Iterable*, *opt: Callable*)

Reduces a set of concepts by applying a binary operation to each pair of concepts.

Parameters

- **concepts** (*set*) – A set of concepts to be reduced.
- **opt** (*function*) – A binary function that takes a pair of concepts and returns a single concept.

Returns

A set containing the results of applying the binary operation to each pair of concepts.

Return type

set

Example

```
>>> concepts = {1, 2, 3}
>>> opt = lambda x: x[0] + x[1]
>>> concept_reducer(concepts, opt)
{2, 3, 4, 5, 6}
```

Note

The operation *opt* should be commutative and associative to ensure meaningful reduction in the context of set operations.

`owlapy.utils.concept_reducer_properties` (*concepts: Iterable*, *properties, cls: Callable = None*,
cardinality: int = 2)

→ `Iterable[owlapy.class_expression.OWLQuantifiedObjectRestriction | owlapy.class_expression.OWLObjectCardinalityRestriction]`

Map a set of owl concepts and a set of properties into OWL Restrictions

Parameters

- **concepts**
- **properties**
- **cls** (*Callable*) – An owl Restriction class
- **cardinality** – A positive Integer

Returns: List of OWL Restrictions

```
class owlapy.utils.OWLClassExpressionLengthMetric(*, class_length: int,
    object_intersection_length: int, object_union_length: int, object_complement_length: int,
    object_some_values_length: int, object_all_values_length: int, object_has_value_length: int,
    object_cardinality_length: int, object_has_self_length: int, object_one_of_length: int,
    data_some_values_length: int, data_all_values_length: int, data_has_value_length: int,
    data_cardinality_length: int, object_property_length: int, object_inverse_length: int,
    data_property_length: int, datatype_length: int, data_one_of_length: int,
    data_complement_length: int, data_intersection_length: int, data_union_length: int)
```

Length calculation of OWLClassExpression

Parameters

- `class_length` – Class: “C”
- `object_intersection_length` – Intersection: $A \sqcap B$
- `object_union_length` – Union: $A \sqcup B$
- `object_complement_length` – Complement: $\neg C$
- `object_some_values_length` – Obj. Some Values: $\exists r.C$
- `object_all_values_length` – Obj. All Values: $\forall r.C$
- `object_has_value_length` – Obj. Has Value: $\exists r.\{I\}$
- `object_cardinality_length` – Obj. Cardinality restriction: $\leq n r.C$
- `object_has_self_length` – Obj. Self restriction: $\exists r.\text{Self}$
- `object_one_of_length` – Obj. One of: $\exists r.\{X,Y,Z\}$
- `data_some_values_length` – Data Some Values: $\exists p.t$
- `data_all_values_length` – Data All Values: $\forall p.t$
- `data_has_value_length` – Data Has Value: $\exists p.\{V\}$
- `data_cardinality_length` – Data Cardinality restriction: $\leq n r.t$
- `object_property_length` – Obj. Property: $\exists r.C$
- `object_inverse_length` – Inverse property: $\exists r^{-}.C$
- `data_property_length` – Data Property: $\exists p.t$
- `datatype_length` – Datatype: $^{\wedge}\text{datatype}$
- `data_one_of_length` – Data One of: $\exists p.\{U,V,W\}$
- `data_complement_length` – Data Complement: $\neg\text{datatype}$
- `data_intersection_length` – Data Intersection: $\text{datatype} \sqcap \text{datatype}$
- `data_union_length` – Data Union: $\text{datatype} \sqcup \text{datatype}$

```
__slots__ = ('class_length', 'object_intersection_length',

```

```
class owlapy.utils.EvaluatedDescriptionSet (ordering: Callable[[_N], _O], max_size: int = 10)
```

```
Bases: Generic[_N, _O]
```

Abstract base class for generic types.

A generic type is typically declared by inheriting from this class parameterized with one or more type variables. For example, a generic mapping type might be defined as:

```

class Mapping(Generic[KT, VT]):
    def __getitem__(self, key: KT) -> VT:
        ...
    # Etc.

```

This class can then be used as follows:

```

def lookup_name(mapping: Mapping[KT, VT], key: KT, default: VT) -> VT:
    try:
        return mapping[key]
    except KeyError:
        return default

```

```
__slots__ = ('items', '_max_size', '_Ordering')
```

```
items: SortedSet[_N]
```

```
maybe_add(node: _N)
```

```

    clean()

    worst()

    best()

    best_quality_value() → float

    __iter__() → Iterable[_N]

class owlapy.utils.ConceptOperandSorter

    abstract sort(o: _O) → _O

class owlapy.utils.OperandSetTransform

    simplify(o: owlapy.class_expression.OWLClassExpression)
        → owlapy.class_expression.OWLClassExpression

class owlapy.utils.HasIndex
    Bases: Protocol

    Interface for types with an index; this is used to group objects by type when sorting.

    type_index: ClassVar[int]

    __eq__(other)

class owlapy.utils.OrderedOWLObject(o: _HasIndex)
    Holder of OWL Objects that can be used for Python sorted.

    The Ordering is dependent on the type_index of the impl. classes recursively followed by all components of the
    OWL Object.

    o
        OWL object.

    __slots__ = ('o', '_chain')

    o: _HasIndex

    __lt__(other)

    __eq__(other)

class owlapy.utils.NNF
    This class contains functions to transform a Class Expression into Negation Normal Form.

    abstract get_class_nnf(ce: owlapy.class_expression.OWLClassExpression, negated: bool = False)
        → owlapy.class_expression.OWLClassExpression

    Convert a Class Expression to Negation Normal Form. Operands will be sorted.

    Parameters
        • ce – Class Expression.
        • negated – Whether the result should be negated.

    Returns
        Class Expression in Negation Normal Form.

```

class owlapy.utils.**TopLevelCNF**

This class contains functions to transform a class expression into Top-Level Conjunctive Normal Form.

get_top_level_cnf (*ce: owlapy.class_expression.OWLClassExpression*)
→ *owlapy.class_expression.OWLClassExpression*

Convert a class expression into Top-Level Conjunctive Normal Form. Operands will be sorted.

Parameters

ce – Class Expression.

Returns

Class Expression in Top-Level Conjunctive Normal Form.

class owlapy.utils.**TopLevelDNF**

This class contains functions to transform a class expression into Top-Level Disjunctive Normal Form.

get_top_level_dnf (*ce: owlapy.class_expression.OWLClassExpression*)
→ *owlapy.class_expression.OWLClassExpression*

Convert a class expression into Top-Level Disjunctive Normal Form. Operands will be sorted.

Parameters

ce – Class Expression.

Returns

Class Expression in Top-Level Disjunctive Normal Form.

owlapy.utils.**combine_nary_expressions** (*ce: owlapy.class_expression.OWLClassExpression*)
→ *owlapy.class_expression.OWLClassExpression*

owlapy.utils.**combine_nary_expressions** (*ce: owlapy.owl_data_ranges.OWLDataRange*)
→ *owlapy.owl_data_ranges.OWLDataRange*

Shortens an OWLClassExpression or OWLDataRange by combining all nested nary expressions of the same type. Operands will be sorted.

E.g. OWLObjectUnionOf(A, OWLObjectUnionOf(C, B)) -> OWLObjectUnionOf(A, B, C).

owlapy.utils.**iter_count** (*i: Iterable*) → int

Count the number of elements in an iterable.

owlapy.utils.**as_index** (*o: owlapy.owl_object.OWLObject*) → *HasIndex*

Cast OWL Object to HasIndex.

class owlapy.utils.**LRUCache** (*maxsize: int | None = None*)

Bases: Generic[_K, _V]

Constants shares by all lru cache instances.

Adapted from functools.lru_cache.

sentinel

Unique object used to signal cache misses.

PREV

Name for the link field 0.

NEXT

Name for the link field 1.

KEY

Name for the link field 2.

RESULT

Name for the link field 3.

`sentinel`

`cache`

`full = False`

`cache_get`

`cache_len`

`lock`

`root = []`

`maxsize = None`

`__contains__` (*item*: *_K*) → bool

`__getitem__` (*item*: *_K*) → *_V*

`__setitem__` (*key*: *_K*, *value*: *_V*)

`cache_info()`

Report cache statistics.

`cache_clear()`

Clear the cache and cache statistics.

owlapy.vocab

Enumerations.

Classes

<i>OWLRDFVocabulary</i>	Enumerations for OWL/RDF vocabulary.
<i>XSDVocabulary</i>	Enumerations for XSD vocabulary.
<i>OWLFacet</i>	Enumerations for OWL facets.

Module Contents

class owlapy.vocab.OWLRDFVocabulary (*namespace*: owlapy.namespaces.Namespaces, *remainder*: str)

7.2 Classes

<i>OntologyManager</i>	An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing
------------------------	---

7.3 Functions

<i>owl_expression_to_dl</i> (→ str)	
<i>owl_expression_to_manchester</i> (→ str)	
<i>dl_to_owl_expression</i> (dl_expression, namespace)	
<i>manchester_to_owl_expression</i> (manchester_express ...)	
<i>owl_expression_to_sparql</i> (→ str)	Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query
<i>owl_expression_to_sparql_with_confusion_ma</i> str)	Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query

7.4 Package Contents

```

owlapy.owl_expression_to_dl(o: owlapy.owl_object.OWLObject) → str

owlapy.owl_expression_to_manchester(o: owlapy.owl_object.OWLObject) → str

owlapy.dl_to_owl_expression(dl_expression: str, namespace: str)

```

`owlapy.manchester_to_owl_expression (manchester_expression: str, namespace: str)`

`owlapy.owl_expression_to_sparql (expression: owlapy.class_expression.OWLClassExpression = None,
root_variable: str = '?x',
values: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None = None,
for_all_de_morgan: bool = True, named_individuals: bool = False) → str`

Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query root variable: the variable that will be projected expression: the class expression to be transformed to a SPARQL query

values: positive or negative examples from a class expression problem. Unclear for_all_de_morgan: if set to True, the SPARQL mapping will use the mapping containing the nested FILTER NOT EXISTS patterns for the universal quantifier ($\neg(\exists r. \neg C)$), instead of the counting query named_individuals: if set to True, the generated SPARQL query will return only entities that are instances of owl:NamedIndividual

`owlapy.owl_expression_to_sparql_with_confusion_matrix (
expression: owlapy.class_expression.OWLClassExpression,
positive_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None,
negative_examples: Iterable[owlapy.owl_individual.OWLNamedIndividual] | None,
root_variable: str = '?x', for_all_de_morgan: bool = True, named_individuals: bool = False) → str`

Convert an OWL Class Expression (https://www.w3.org/TR/owl2-syntax/#Class_Expressions) into a SPARQL query root variable: the variable that will be projected expression: the class expression to be transformed to a SPARQL query positive_examples: positive examples from a class expression problem negative_examples: positive examples from a class expression problem for_all_de_morgan: if set to True, the SPARQL mapping will use the mapping containing the nested FILTER NOT EXISTS patterns for the universal quantifier ($\neg(\exists r. \neg C)$), instead of the counting query named_individuals: if set to True, the generated SPARQL query will return only entities that are instances of owl:NamedIndividual

`class owlapy.OntologyManager (world_store=None)`

Bases: `owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLontologyManager`

An OWLOntologyManager manages a set of ontologies. It is the main point for creating, loading and accessing ontologies.

`__slots__ = '_world'`

`create_ontology (iri: str | owlapy.iri.IRI = None) → owlapy.owl_ontology.Ontology`

Creates a new (empty) ontology that has the specified ontology IRI (and no version IRI).

Parameters

iri – The IRI of the ontology to be created, can also be a string.

Returns

The newly created ontology.

`load_ontology (path: str = None) → owlapy.owl_ontology.Ontology`

Loads an ontology that is assumed to have the specified ontology IRI as its IRI or version IRI. The ontology IRI will be mapped to an ontology document IRI.

Parameters

iri –

The IRI that identifies the ontology, can also be a string.

It is expected that the ontology will also have this IRI

(although the OWL API should tolerate situations where this is not the case).

Returns

The OWLOntology representation of the ontology that was loaded.

apply_change (*change: owlapy.abstracts.abstract_owl_ontology_manager.AbstractOWLOntologyChange*)

A convenience method that applies just one change to an ontology. When this method is used through an OWLOntologyManager implementation, the instance used should be the one that the ontology returns through the `get_owl_ontology_manager()` call.

Parameters

change – The change to be applied.

Raises

ChangeApplied.UNSUCCESSFULLY – if the change was not applied successfully.

save_world()

Saves the actual state of the quadstore in the SQLite3 file.
